>Where can I buy the gear?
>How much?

The Americans only think about "buy the gear" and "how much".
However, there are designs (from Slovenia) and designs+kits (from Germany)
for doing these things. And probably others.

>> Also 23cm has 7 channels at 150Khz wide already allocated for high-speed
>> packet. Having the bandwidth to do it is not a problem, the equiptement

Same answer.

>> 5. We also need to forget DOS bbses, KA9Q or whatever else you're using
>> now. Standard ethernet interfaces on Linux, BSD, Unix for the links.
>> Standard serial or ethernet comms for the access points.

>Where can I buy the gear?
>How much?

You sound like the familiar old record player.
But we have seen that many times before in postings from you.

Rob

The problem is:

-The job is not interesting

-The job is time consuming

-It looks like a product of general usefulness that is better in every way than the commercial products now sold

-I may have missed a feature that someone more knowledgable would add

-I would rather pay someone to do it and instead play with my radio or work on the 20 other ham-related jobs I have to do that no one else can do for me.

"Americans" do not think this, but I personally happen to be
interested in buying such gear because I *cannot* build it.

You want to build some? I would buy it.

> How much?

Well, it is conceivable for a ham to build his own gear. However if thats out of scope for whatever reason, try starting here:
http://www.wa4dsy.net/ [Look at the 56k modem]
http://hydra.carleton.ca/articles/hispeed.html [Look at the speeds above 19.2]
http://www.dutch.nl/bdj/index.htm [Transmitters are here]

http://hydra.carleton.ca/info/pi2.html [Modem cards, nolonger in production, but availible]
http://www.hamradio.si/hid.html [The guys in Slovenia]

and many many more. do a google search for a starting point. Infact you could probably put together a solution from products already on the market, if you did it modularly. What i would like to develop would be an integrated black-box solution so that people like yourself who only want to ask "Where can i buy it, how much" can get on high speed packet too.

>
> Where can I buy the gear?
> How much?

www.rse-electronics.com [Produce a bit of baseband gear, you can use two tx/rx pairs together with shielding]
Also other modified home-brew ATV circuits would do well (no need for (de)emphasis) or Audio sub carrier.

>
> > 3. AX.25 - ditto my comments on 9600 for backbones. Just forget it. and no

>
> Why?
> Do you need it on 20M SSB too?

I would say no we dont need it on 20M SSB, because on 20M there is plenty of activity, data is not practicable at high speeds due to bandwidth constraints. However if there were the bandwidth availible on HF (which there is nothing like the amout we would like), say a few more Mhz then i would very much like to see stations able to patch calls through from hams in rual areas like on the old ship-phones.

OK:
Linux, try: www.redhat.com for a simple to set up distro.
www.debian.org for a more tweak-able amateur one.
Theres also slackwere, mandrake, linux-from-scratch and many others; the kernel from www.kernel.org
Linux is free.
Ethernet cards are availible for ~ $20 or �10 from your local PC supplier.
Serial comms cards similarly, and the modems are availible from companies listed at
http://hydra.carleton.ca/articles/hispeed.html

>
> > 5. The IP address co-ordinators need to start putting their phone numbers

Which is exactly why email/tel numbers would be useful.

>

>
> So do it. Make a bunch of money.
> Or is it the usual hot air and no action babble?

How about the fact that I am to busy with my education at the moment and dont have the money to do the development on my own. However if you will help me, then I will happily try. Infact this is something i hope to do in my gap year; to produce a marketable product for high-speed packet cheaply. I have already been looking into the cost of tx/rx modules, how standard commercial hardware can be incorporated to keep the price down etc. If you are interested contact me, also see what the guys in Slovenia did, they have the right idea.

> > Untill this happens, or someone asks for my help in making this happen, or

> Ah ... I see ... you can't do it.
> I've been asking for these products since 1986.
> Why can't I buy any?
> Because the folks that claim it is "easy" are unable to actually do it.

Its easy, I can do it. However it is also a hoby. I am currently busy with my main aim of a formal education. When i have the spare time and some spare money i will do it. Please remember that this is a hobby and whether i develop somthing like this for the good of the amateur community is up to me; its not an obligation. If i was paid to do this then you would have a right to complain that i hadnt come up with the goods yet.

Actually, I'm talking about in general. I've read there is packet activity on 70cm, but on the band plan there is no allocation for digital modes on 70cm. Any idea what frequencies might be used?

Yes, because of you want gear or kits we have to buy it. I do not know of

what alternatives you have to purchase, but they generally are not legal
here.

Slovenian gear, you said? Do you know of a place where I can find out what
is available? Or is this an erroneous asking of "where can I get it, and
how much?" The only thing I detected was a distain for folks who ask where
they can get kits or radios and how much they cost and a countries' name
"Solvenia" -- no other information. Do you have it?

I am curious, though, who has these kits? Do you have a compnay name or
supplier I can find out what is on offer?

Thanks,
Brent

It is trivial to run tcp/ip over wires ... it's called the internet.
I'm using it right now.

We already have tcp/ip running just fine here, using radio.
It is simple to do.

The protocol makes little difference to me ... what we have
works fine. But I'd sure like some faster hardware. Not a kit.

Not something I have to tweak and align and build. Something
I can plug into my computer and my coax. I'm not interested
in that part of the project. I am intersted in the software part.

That is software. I have plenty of software that does exactly
what I want to do, and can write more as needed. It's free.

> Ethernet cards are availible for ~ $20 or �10 from your local PC supplier.

I have bunches of them.

Um ... what does this have to do with radio ???

I already *have* a *lot* more software capability than any of the stuff
you mentioned. Software is hardly a problem for me :-)

Now tell me about the radios.

Oh, wait, you must think this newsgroup is alt.hams.playing.pretend.radio ?
You seem unaware of what is being done over the air already.

Oh, never mind.

I'm busy being retired ... but I have already done three different business
plans: one for software and two for hardware. None, as it turned out,
would produce a viable busines. So I stuffed 'em in the "Good ideas
that did not work out" drawer in the file cabinet. If you have a plan you
think might work, there are some of us out here that might well fund
such an undertaking. So get the education, don't forget both the
technical and business parts, and (as my favorite VC used to say)
"Come with a plan and we'll talk."

Frequency use on VHF / UHF is regional.

If you were here in NW Oregon or SW Washington, the info
on my web site would tell you all you need to know.

But you are in NJ, some 3000 miles away.

I tried Google and got dozens of hits ... including general information
about packet in NJ, network design, software used, etc. etc. etc.

Yes, they exist - as backbones. Not so much as individual stations. At least that's what I'm seeing here. Correct me if I'm wrong, but I heard that you don't see much speed increase until you get to 9600 bps full-duplex. Until then the lag time waiting for the receiver to turn around kills you.

We got some nice frequencies up in the microwave band. What about 10Mbs? We at least need to start getting up to speeds that rival DSP if we want to create a stir again.

And we'd better start using them before all the other 2.4GHz Part 15 device makers start screaming for more spectrum. It's going to hard to argue that the public is better served by letting only those who have a license keep it then turning it over to anyone who can buy the equipment.

There's also a good legal question that needs to be settled - Once we do have high speed packet, for sure something that's going to be wanted is Internet access over that link. How legal would it be to put the family computer on a ham link and do some web surfing? Or pay some bill? Or download some porn? What is acceptable use for a digital link in the internet age? Or has this been answered already?

For Gary and Rob
You apparently did'nt read my msg!!!
As I said Packet/1200 simo with Pactor/9600 is for the hams
who go a step further than just being a ham.   Some of us volunteers
spend many years and hours weekly in support of the dear old USA.
We know what FEMA stands for do you?
We know what happened on 9/11 and acted on it.  Did you??
I have been doing it since 1940 (it was called AARS then)
I got my ticket in '37.   The AARS goes back to the late
20's,  the MARS back to 1950 when all 3 branches of the
service combined.  But then maybe you guys are too young to
even have heard about such extensions to HAM radio.
One must be licensed as a ham to even get into MARS work.
And believe me when the winds howlin outside, or the river
just entered your basement or even worse the country is
threatened as on 9/11 then you know where we stand.   Quit
knocking Packet and Pactor.   They are alive and well and in
good hands.
             Joe/KH6JF/ABM6JF

If the emergency services are to be relied upon, then there should be a
minimum standard. I think it is unreasonable to rely upon a hobby to do it.

Forget 2.4 it's a zoo. We have better bands.

That's not legal of course. So we don't do it. Duh ...

In any case the issue I commented on was emergency services.
In case of emergency, you do what is needed.

Guess I missed something somewhere.
You still use 1200 baud links?
Why?

I guess it comes down to $$. It takes fancier radios and better TNCs.
I've got a couple of 1200, but haven't run across a 9600. Not even
sure there are any 9600 nodes for me to talk to.

>> At least that's what I'm seeing here. Correct me if I'm wrong, but

Then tell me, what real-life throughput do you see on a 9600 network
over a 1200? While 9600 is 8 times faster then 1200, in real-life
that time delay in turn around is going to eat away at that number.

Which ones? I asked a loaded question. I'm not sure what most hams
are going to find in packet if they have to have a internet connection
anyway.

> In any case the issue I commented on was emergency services.
> In case of emergency, you do what is needed.
>

I agree. It's a good mode for certain tasks. But emergency service isn't going to give it a good life or create a lot of interest in it. It needs something to commend it as a hobby for the fun of it.

The big mistake in the early days was to use existing FM radios for packet. To allow that, the 1200 baud afsk modem was chosen. It has been inferior since day 1.

From then on, the average amateur believed that packet was just a mode he would use over his existing equipment, and packet was doomed to always be a slow speed mode.

Somewhat faster (9600 bps) modems were designed but they would not work well on the average commercial transceiver, and dedicated data transceivers were designed, but they were usually only available in kit form or had nondesirable properties like being single-channel.

Apparently, the Japanese industry saw the potential of packet radio far too late, and they made a false start by marketing "9600 bps ready" transceivers that weren't. By the time they understood that a data-ready transceiver meant the inclusion of a modem, they just included old standard slowspeed modems and crippled TNCs.

Look at what the computer industry did at the same time: they understood that for transferring data over radio a telephone modem and NBFM transceiver is a poor choice. They developed spread-spectrum hardware and standardized it. They built radio boxes with a sensible interface (pcmcia or ethernet).

Amateurs could have done a similar thing, and with help from the industry (for those users that do not want to homebrew) it could have been a similar success. For some reason it did not happen.
A Japanese data radio available in the ninetees, priced like an NBFM mobile radio but transferring >=56kbps data instead of voice, would have meant all the difference.

Rob

I've got to say that this thread has been fun. The strange notions some of the posters have about packet... It's priceless, like the innocent things that children sometimes say.

In the last few weeks, I have been in contact with movers 'n shakers from over a dozen packet networks throughout the USA, toured their web sites and discussed the hobby with people who actually build network, as opposed to just talking or theorizing about it.

Then I came back here... It's really been a lot of fun to follow this thread. So far, I've heard about several items that allegedly "do not exist" - that actually do, and in a big way.

Behind most humor, there is a tragedy.. After all, somebody has to hit the deck, after slipping on the bannana peel. The tragedy here is the widespread, deep ignorance within the US, as to what kind of packet network resources we have at our disposal. - What kind of capabilities we have.

What is especially tragic is that we have good reason to be proud not only of what we already have, but also of what is currently being built. - But we don't express that pride because so many hams have been parroting the baseless mantra that packet radio in the U.S. is "dead". - You know how it goes... Repeat something often enough, and people start to believe it.

What I have been discovering is that packet in the US is a lot better than most U.S. hams have been led to believe. - Even the optimistic ones!

I am still in the process of gathering info on our network resources, but to see some of what I have discovered in the last few weeks, go to http://www.uspacket.net and press the "Network" button.

Yeah, its pretty funny. You fellows have proven my point, and the original poster's point a couple of times over.

Certainly there is a small, very small, niche of active packet users in the country. But if you think that this small user group will support a nation-wide network, well then, go for it.

The original poster asked if packet radio was dead. You guys answered no, but are unable to show any concrete proof.

What is concrete proof? Well, go to any large metropolitan area. Listen on any of the usual 2-meter VHF frequencies where packet used to be. Hear anything?

Ask some of the other fellows when or if they use packet. Count the "yes" answers. Still have fingers left?

If the packet network really exists and is efficient, why don't the respondents answers carry a packet network address?

Personally I'm just stating my opinion. I gave up on packet years ago after the empire builders in the Pacific Northwest got to be too much of a PITA. History has proven me correct. Now its YOUR job to show those of us who have become disinterested why we should invest time and money in something that only served to boost the ego of the venerable "sysop".

For Joe, yes I know about the military uses of packet. You yourself admitted that for real passing of traffic, PACTOR on HF is the preferred method. Packet is only for local networks on VHF, right? I have not listened to MARS frequencies lately, but If they are like any of the so-called "traffic" nets on Amateur HF, well lets be charitable and say that your chance will come, maybe... In the meantime, enjoy puttering around passing canned "traffic" amongst your selves.

Oh, the irony!

Mostly the answers are pretty much as expected. When someone from "outside" comes into the temple and begins asking pointed questions, the acolytes quickly close ranks and force out the unbelievers.

Speaking as an Infidel, I say "Show Me!"

Now back to your regularly scheduled argument.

Gary WG7X

I did. Apparently you weren't clear. Please do not throw stones, might be
a better use of your keystrokes to CLARIFY what you are trying to say.
(For instance, what do you mean by "Basis and Purpose, that's why" -- does
that mean that packet SHOULD BE or SHOULD NOT BE used as an emergency
service?)

>>>> One thought regarding the original idea:

>>
>> It isn't supposed to be an emergency network.
>
> Then why bring it up with respect to emergency networks?

I didn't. I was saying you can get 1-11Mbs for very little money, and
people are making community networks (WISPs) which are growing like crazy
based upon 802.11b standards and they do not need a license. Perhaps that
is why Packet is not popular.

My summary:

1. Ham is slower
2. The faster standards do not require a license

I also neglected to point out that if the power goes out, 90% of packet
networks are likely to go out, but cell phones and other emergency services
won't.

You know what? I have been a ham for over 10 years, but have not been
terribly active simply because, while most folks are relatively friendly,
even when asking a difficult question. Folks like you who seem to want to
harangue and insult to make yourself feel better tend to keep the hobby

small.

Interesting, well since I live on the Gulf Coast, and we do get some pretty bad
storms, sometimes there called Huricanes.
Anyway when we do get these Storms guess what becomes useless DA, Cell Phones.

Interesting. Most cell sites have significant battery and generator backups and pride themselves on interruptable service. Now, if the antenna is knocked down, well, that's all she wrote in any wireless service! :)

For Gary and others.
If your a licensed ham and wish to dedicate yourself to something other than "rag Chewing" or "DXCC", file an application for membership in MARS. Any version of MARS Army/Airforce/Navy-Marine corps. ARMY alone at the last Dayton Hamvention signed up a hundred or so new members. They knew they were faced with a "basic training" course on the MARS way of communicating and they new they would have to file monthly participation reports, and they knew they would have to follow MARS proceedures once selected. As for PSK/MTTY/ and most of the sound card gimmicks, they are not very useful to MARS since all Traffic sent within MARS must reach its destination "error free". Both packet and Pactor insure that they will. As to a system wide MARS comms system we have it. Eastern/Western/Pacific Gateway systems. All including most MARS members have APC's of all types, so the argument of power loss means death is an invalid assumption. Emergency power is the desert we enjoy most. Believe me Cell phones die like they were hit by a virus under such conditions. This is my final word on the subject. Show us what you've got!!
Joe (aka kilroy)

I have a kenwood ts-430s and I'm interested in trying winlink/airmail
for a trip. I'm a complete newbie to digital on HF. I know the
SCS-Pactor II TNC's are supposed to be great but a bit pricey for me.

So I've been looking at an AEA PK232 since I can get a used one that
supports Pactor I for under $100. I understand it will be a lot slower
and not as reliable but I figure if I like it I can always sell the
AEA and move up to an SCS TNC.

I was wondering if people have experience using Winlink/Airmail with
these TNC's?

Will I need to make my own cable to connect the TNC to my Kenwood
TS-430s?

Will I need the optional narrow SSB filter as well?

Thanks,
Todd

>
> 1. Ham is slower

Than what?
Existing 802.11b services?
You are again kidding, right?

> 2. The faster standards do not require a license

They do if they are run on the Ham bands.

> I also neglected to point out that if the power goes out, 90% of packet
> networks are likely to go out, but cell phones and other emergency services

90% of the packet network here will remain running, as it did
the time a few years ago when power was out across the whole
metro region (50 miles by 50 miles). Packet still worked.

I did not start this harangue OM.
I posted some suggestions, you tore right into them.
So you get flamed.
Try posting some suggestions about how to use Ham Radio.
Otherwise you are part of the problem.

Sometimes cable goes out too, along with power and telephone.
e.g. hurricane Gloria, which passed right over Westford, MA
while we were living there. Phones were back in service in a
couple days. Power was out for nearly a week. Lots of free
firewood availble though :-)

After the Loma Prieta quake, one of the major packet nodes
was down. It was located very near the epicenter, and the
"hardened" AT&T bunker in which it was located was found
several hundred feet downslope. The rest of the network was
running just fine. Phones (wire and cell) were not ...

We see about 8 times the throughput.

Um ... doing something with radio? Antennas, feedlines, that kind of stuff.
Cannot do that on the internet. Your local telco or cable company will
get it's shorts all in a twist if you try.

I'll say it again: we have a very nice packet network here.

For "concrete" proof you will either have to come here and
see it in action, or connect here via HF and see what is here.

If you don't know HOW you might connect here via HF,
then you have not done your homework!

Out of curiosity, how do you plan to use it? The problem I see with a
PDA is that while it's small and very power efficient, the data entry

is horridly slow and typically there's no printer.

If you can still use an external keyboard while the TNC is connected
then that's one problem solved. But then there's still the issue
about how to print.

Unless I'm missing something, a truly effective packet station is
going to need both a keyboard and a printer. Or is this just for APRS
or digipeating?

I'll sell you my antique KAM real cheap if you want to put
it on air. Have had the VHF port on air within the past month,
but have only tried the HF port once, and found that it might
need the connector resoldered, or maybe I had a bad cable.

But you can have it a lot cheaper than $100 :-)

It does not.  It only relates to the original thread of packet being "nearly
over" -- I pointed out that alternatives that do not require a ham ticket
and are much faster.

Hi Todd,

Pactor I will work with Winlink but I think you will find the throughput unacceptable for all but the most minimal amount of traffic. Pactor II (and especially Pactor III) is night-and-day better, and pretty much required for practical use (and yes, the SCS TNCs are indeed not cheap, a situation made worse by the fact that it is pretty rare to find a used one for sale - which should tell you something... :-) But that said, Pactor I will work if your main interest is getting your feet wet and seeing if the system meets your requirements. A 500 hz filter is sometimes handy but not at all essential, especially with the DSP-based TNCs which really don't care about any audio in the passband other than what they're looking for. The filter can help keep nearby QRM out of your receiver's AGC, but this won't be a problem all that often. I would save my money on this unless your operating experiences indicate that you need it.

Go for it, you will have a lot of fun getting everything set up and learning the ropes. If you need low-bandwidth HF email access then I believe you will find Winlink/Airmail a very good solution, but if you end up using it much you WILL be trading up to an Pactor II TNC sooner or later.

Feel free to email me privately if you have any more questions (remove the '-removethis-' text from my return address above).

73,

- Seth

Hank,

I know how to, the point is I don't care to.

Neither do most other hams outside of the cabal.

PITA, that's the name of that game.

Amateur radio shines in so many ways simply because we are there, and have communications capability when the chips are down.

In an emergency, look to the Amateur radio contest
community for the best stations, located in the right
spots with well trained operators.

That's what's needed...

'nuf said.

Gary WG7X

Well ... I'm at one of those locations, with two HF stations
on air here 24/7. How will you handle the Excel spreadsheets?
How do you think the emergency responders handle their
SITREPS nowdays? It ain't on paper anymore ... and hams
need to provide digital links to be of any use at all ... beyond
the obvious and traditional tactical comms.

NTS certainly cannot handle the amount or type of data
needed. I keep poking at this only because I think it is
important that hams move out of the 1930s capability
and at least make a try at being useful in the modern
age of digital networking.

"When the internet is down, hams ... do nothing ..."

I am interested in learning how to program a Windows soundcard for various communications modes and related tasks. I have downloaded and used programs that support modes such as RTTY, PSK31 and SSTV, but I would like to learn to 'roll my own'. I am a competent Borland Delphi programmer and can write programs that talk to Windows or Soundcard DLLs or other low level interfaces when needed.

Is there a good reference book or online site to get me started?

Thanks and 73,
Mark, N8ME

Does anyone know of a Windows program that uses a soundcard to decode the
time information encoded in the WWV audio and set the computer clock
automatically? The signal format is documented on the WWV website. I know
there are other ways to get the time, but since the information is there, I
figure why not use it?

Why not?

Well, you need a receiver, a sound card based decoder, and then time syncronization software. You would wind up with a complex system that wouldn't be all that accurate.

Or, you could just run a ntp client on the computer and get good time the same way the big boys do.

See http://www.kaska.demon.co.uk/ for one such client.

If you still want to do this as a home brew project for whatever personal reason, see http://www.eecis.udel.edu/~ntp/ where you can find the ntp code which you can use as the basis for the decoding and time synch parts.

Sorry, no link for getting the audio to ones and zeroes with a sound card, but there used to be a link on the ntp site to a simple hardware decoder.

I already have a receiver hooked up to my computer used for other sound card based digital modes. I want to learn how to develop such a sound card based decoder. I appreciate the need for accuracy where critical timing is made, but I'm not concerned with sub-second accuracy. Basically, I am developing software to control an HF transceiver (currently a TenTec Pegasus). I plan on using the WWV frequency to tweak the frequency calibration (my particular transceiver, appears to be about 20 Hz off WWV at 15 MHz). I plan on using the soundcard to automatically zero-beat the WWV signal and automatically adjust the calibration factors in the software. I figure while it's at it, it may as well set the computer clock.

More than anything it's a challenge for me to learn how to use the soundcard from within my own program.

But then you need an Internet connection!
And you get accuracy that is difficult to predict, might well be worse
than the receiver.

An accurate alternative would be a GPS receiver with PPS output.

In that case, you either need an open-source implementation or a good description of the protocol. It is usually not very difficult to sync to clock signals with moderate accuracy, but I have no experience with WWV (here we use DCF77).

Hardly a "shame". It's what we live for! Remember that the USA was begun by a volunteer "army" and statesmen. The army and politicians have changed a lot since then, but the spirit of volunteerism is still alive and fairly well. When something happens, we want to be there! We want to help! Look at how many millions of volunteer hours went into the 9/11 aftermath!

Every week we are involved with providing communications for public events. It's not much of a stretch to be ready to provide communications for emergencies. It's not "positioning". It's being there, and being ready to be there, when something happens, when there is a need.

dave allen, wb0taq, colorado

You need to go to http://www.eecis.udel.edu/~ntp/ and read up on how
ntp works before making such ridiculous statements.

> An accurate alternative would be a GPS receiver with PPS output.

Sure, and for about $5000 you can get a network ready NTP GPS time source
that keeps your clock accurate to some small number of nanoseconds, but
I highly doubt that either solution is what the original poster has in mind.

I have been running an NNTP server for a long time and I know how it works. My server is synced to a radio receiver and two Internet systems and I can observe the effects of unbalanced roundtriptime on the connection. I have also graphed the jitter on the radio received timestamps and analyzed the effects of daylight/nighttime propagation and the changes over the seasons.

Before you call the statements ridiculous, please make similar efforts and don't read only theory documents.

>> An accurate alternative would be a GPS receiver with PPS output.

Alternatively, you can get a $100-$200 OEM GPS receiver module and easily obtain precision that is much better than you ever are going to get with WWV or NNTP. Checkout W3IWI's "totally accurate clock" design.

> In that case, you either need an open-source implementation or a good description of the protocol. It is usually not very difficult to sync to clock signals with moderate accuracy, but I have no experience with WWV (here we use DCF77).

The time encoding document on the WWV website. It is a simple pulse width encoding of a 100 Hz (I thnk) audio tone on the WWV signal. It's quite visible when looking at the WWV signal through and audio filter program. It takes close to a minute to encode the entire day / time info.

Depends on your definition of "reasonable", but even a dialup and NTP
will keep a system in the tens of millisecond range.

I run an NNTP server also, but I use it for USENET news.

The NTP implementation keeps the time correct.

If you know how NTP is implemented, then you know it goes to great lengths
to calculate and correct for network delays, dispersion, and system clock
drift. Your radio prop delay can never be known as accurately because
there is no feeback mechanism back to the primary source as in a TCP
connection.

Perhaps this is why WWV, CHU and the rest were abandoned as time sources
by those who REALLY want or need accurate time once GPS came on line.

You are also mixing apples and oranges; WWV and GPS are time sources, NTP
is the mechanism to obtain the time from the source and correct a
computer system clock using algorithms to correct for the errors introduced
by the underlying information transport, i.e. TCP/IP.

> Before you call the statements ridiculous, please make similar efforts
> and don't read only theory documents.

All the work was done long ago by people much better at it than either
you or I.

You are fooling yourself; hanging a GPS receiver off a computer without the mechanisms embedded in NTP gives you squat, and again, it is NTP not NNTP.

No one uses WWV as a standard for NTP anymore, it's been GPS for years now.

The totally accurate clock is an interesting toy; for $300-$500 you can get a complete GPS based NTP server box that keeps the system in the low milliseconds range.

Go read the following and get back to me:

Mills, D.L. Internet time synchronization: the Network Time Protocol.
IEEE Trans. Communications COM-39, 10 (October 1991), 1482-1493.

Yang, Z., and T.A. Marsland (Eds.). Global States and Time in Distributed
Systems. IEEE Computer Society Press, Los Alamitos, CA, 1994, 91-102.

None of this, however, is in the slightest bit relevent to the original posting.

Ok, then it is quite easy to decode it with a soundcard. DCF77 uses a
direct amplitude modulation of the carrier with pulses of 100/200ms so
the demodulation is normally done in hardware and the signal fed to a
COM port, demodulation is then often done in software. The NTP daemon
has built-in software support for that, maybe for WWV as well.

Example of NTP synced to a DCF77 receiver and two Internet NTP sources:

```
     remote           refid      st t when poll reach   delay   offset jitter
==============================================================================
*GENERIC(0)      .DCFa.           0 l   24   64  377    0.000   -1.727 3.720
+fistix.xs4all.n ntp0.NL.net      2 u   17   64  377   14.881    6.338 1.461
+ntp1.NL.net     .GPS.            1 u   58   64  377   24.829    5.120 1.519
```

As you can see, in this case the jitter is even less on the Internet
sources than on the local receiver. But that is over an unloaded ADSL
link. When it is busy, the jitter goes way up and so does the offset.
(values are in milliseconds)

> Example of NTP synced to a DCF77 receiver and two Internet NTP sources:

Rob,

I'm sure you remember that there's a (very Sun specific) WWV refclock implementation in the current NTP sources at UMD. I tried to twist it up on a FreeBSD4.5-release machine and found that it was very very very insistent about wanting to be on a Sun; the #ifdefs were adamant. A slightly closer inspection showed that the truly Sun-dependant bits were well-localized, and that I was going to need to read the Sun manpages quite closely to do the port. Then again, I'm not a multimedia person.

But then other things happened, as is often the case :). As to whether a non-*nix person would find any of this the least bit relevant, I have no idea. Certainly there would be glory in it, especially a port to Linux (which I don't run, so don't look at me!)

regards,
Ross ve6pdq

What kind of throughput speeds can I expect (ballpark) doing Pactor I on something like an AEA PK-232 on 20 meters versus an SCS doing Pactor III?

Thanks,
Todd

Lee, rather than using ham radio, I would use a cell phone. In England
at least, stolen cars can be hundreds of miles away (and even shipped
overseas) within a matter of a few hours. The chances of successfully
phoning home via APRS would be virtually zero, whereas a cell phone
would work reliably over very long distances.

Hello W6DKN

> If the application you are trying to use for TNC control is trying to
> directly access the hardware port, then it won't work. W2K, like any
> version of NT, is a protected kernel OS. Any app that needs hardware
access
> must request it via an OS API call.

As you say, you cannot write a Win32 application for use in NT/2K/XP which will successfully write directly to a hardware port (x86 IN and OUT instructions) in user mode. It will generate an exception.

If the application is an MS-DOS app, under NT, 2000 and XP the UART IN/OUT instructions are intercepted with a trap and have code to attempt to re-emulate the COM port using a Virtual Device Driver (not to be confused with VXD which is a Win 3.x, 9x & ME term). Works sometimes, not others, in particular regarding heavily used interrupt driven applications as these can often be timing sensitive: these traps are expensive in CPU terms.

It will even let some MS-DOS programs access a USB Serial port if you're really lucky.

Windows 3.x [enhanced mode], 9x & ME use a different method and simply map most I/O reads & writes straight through to the hardware.

As an example, I often use the InstantTune Doppler correction facility which is a DOS TSR under Windows 2000 and this works fairly well.

I'd suggest that either the cable isn't right or a handshake line at the PC end isn't properly connected. Either way, the use of a terminal emulator (such as Hyperterminal, but I prefer TeraTerm Pro) and investment in an LED RS-232 status box invariably resolves these problems rapidly.

This bit of tutelage coming from someone who uses:
NG
OM
CB
in his post? How dare you?!?! Oh, wait....let's see:

NG- anyone on Usenet more than an hour knows this.
OM - anyone involved in HAM radio more than a day knows this.
CB - anyone not living under a rock for the past 30 years knows this.

Moreover, most operators involved with digital comms knows what
a *GASP* TH-D7A is, comm software version numbers, let alone a TNC!
W2K? What, are you running CP/M on a Kaypro?

The original poster stated very clearly what he was asking, UNLESS you are a CBer!

(Oooops....better spell this out....by 'CBer' I mean a carbon-based hominid
lifeform from the planet Earth* partaking in reception or transmission of
radio
frequency energy currently appropriated to the Citizen's Band radio
spectrum.)

*Earth - Third planet from the only star in the Sun solar system, Cygnus
spur
of the Orion arm of the Milky Way galaxy, sister to Andromeda.

Clear enough, OM?

Next time, run a search on the acronyms and /or model numbers YOU are
unfamiliar with. Then, you may partially elevate yourself above the CB
mentality.*

*CB mentality - be ignorant, speak like you're the authority, repeat ad
nauseum.

Do a Google search on "DirectIO" and then follow some of the links. There are several products, a few shareware, that emulate a hardware serial port to the application, and use the Win NT (2000, XP) API calls to actually talk to the port. Some of them even work :-) None that I've found will support applications that need access to the system timer interrupt though. One claims to do so, but fails to work. Many packet applications hook the timer interrupt as well as the COM port hardware interrupts. Those won't work on Win NT (2000, XP) at all.

My own solution is to keep a DOS machine and a Win 98SE machine around. The computers are junkers I got for free. They are on the house network.

Now I can run any of the older software ...

Stupid boy.

There is a big difference between using jargon and quoting meaningless commercial products in CB (Cheque Book) fashion. _REAL_ Radio Hams manufacture their own rigs and take to the writing of software like a duck to water. CBers buy everything off the shelf and then get confused when they don't have sufficient technical acumen to sort out problems in their off-the-shelf gear.

Hallo,

ich w�rde empfehlen eine (gebrauchte) aber vom Handling immer noch
Top-Aktuelle
3.34 MPixel Kamera wie die Nikon Coolpix 990 zu kaufen. Preis bei ebay etwa
350 - 450 Euro, kann auch in USA bestellt werden 350 - 450 $.
Die neue Coolpix 4500 hat ein kleineres Display, allerdings
Top-Motivprogramme,
die man als Halb-Profi nat�rlich verabscheut ... ;-)) aber dann gerne
benutzt wenn
sie so gut sind wie hier.

Vorteile Coolpix:

- viele manuelle Einstellungen (Sch�rfe/Belichtung/Blitz ...)
- Sehr guter Algorithmus f�r den Chip (kaum Unterschiedc zu anderen 4.0
MPixel)
- Mit dem drehbaren Objektiv optimale Handhabung auch in ungew�hnlichen
   Aufnahmesituationen ...
- Zubeh�rprogramm auch bei der neuesten Coolpix 4500 fast unver�ndert,
  d.h. viel Zubeh�r wie Objektive/Konverter, Kabel, Blitzschiene etc. sind
   in grosser Zahl verf�gbar

Alles das, was die Sony P... nicht k�nnen, k�nnen die Coolpix mehr .

Gruss
E.rhart

Yes, but The World is a Very Big Place. There are areas in the US where you'd be hard pressed to find anywhere that *isn't* covered by an APRS digi. In those areas, using APRS as a poor-man's LoJack makes perfect sense.

Obviously, if you're in the middle of the Mojave desert, that could be another story.

Personally, I used APRS just as a convenience for myself and my family. Any assistance it could provide in tracking someone who wants to steal a 13 year old car would just be icing on the cake.

TROLL! Now, where'd I put my 12 guage loaded with troll shot?!? :)

"Stupid boy"? Surely, you jest.

S'matter, OM? World passing you by, and all you can do is piss on it out of spite?

His "jargon" was right in line with his question, fool. Simply because is sounds like gobbledygook to *YOU* does not mean it is "meaningless", as you are so inclined to say.

It was chock FULL of meaning to any HAM who deals with digital communications. To a "stupid boy", it is meaningless. (That's your cue!) Enter Bairn Reay, stage left.

Now you know where and who you are. A true CBer. All mouth, no brains. :)

As far as "manufacture their own rigs", well, bucko, show me *YOUR* waferfab and SMD assembly facility. Also, please demonstrate to the NG your "sufficient technical acumen" to code the logic into those EEPROMS, PROMS, processors, etc.

Show us your "homebrew" rig with built-in TNC.
Show us your "homebrew" DTE device to gain terminal access to such devices.
Show us your "homebrew" firmware that controls such devices.
Show us how you wrote it without the use of any COTS items.
Show us how you mined your own heavy metals used in your personal facility to create such devices.

This software that you "take to writing like ducks to water"...ummm, was this written on a "homebrew" machine? The language it was written in, did you create it? The devices the code was stored on, were they created out of personally mined iron ore?

You ain't real, fool.

There's a LOT more to HAM radio than just being an old fart who thinks "his way" is the only way. Hitler was one of those types. Your folks should be so proud.

Time to go change your Depends Undergarments. The stench has whazzed your brain.

PS to NG: Pardon my divergence from the "no feeding the trolls" sign. :)

Hello Hank

> that emulate a hardware serial port to the application, and
> use the Win NT (2000, XP) API calls to actually talk to

Yes, these are all device drivers operating in kernel mode with a Win32 user mode API.

I first used one of these a couple of years ago with some mods I wrote for WispDDE to make it work with some parallel port devices under NT, which has since been documented with the application for quite some time.

I was very careful to specify that:

> > you cannot write a Win32 application for use in NT/2K/XP which
> > will successfully ***write directly*** to a hardware port (x86 IN and
OUT
> > instructions) in ***user mode***. It will generate an exception.

> None that I've found
> will support applications that need access to the system timer
> interrupt though. One claims to do so, but fails to work.
> Many packet applications hook the timer interrupt as well
> as the COM port hardware interrupts. Those won't work
> on Win NT (2000, XP) at all.

Yes if someone's managed to write a Win32 app that tries to access the IN/OUT instructions directly it won't work, but 16 bit apps might work if you're lucky using the NTVDM. InstantTune, for example, works and uses the system timer and interrupt driven UART extensively.

> My own solution is to keep a DOS machine and a Win 98SE
> machine around.

Yes, I do the same, but it's not very convenient! BTW, DOS apps dependent on the system timer in W9x will loose ticks when not in the foreground even without suspend set.

Is packet nearly over?

Nope, it's growing again, coming back bigger and better than ever.

Want to be part of that? Come see us at USPN.

http://www.uspacket.net

Picture this: an external USR 56k v92 modem connected to the COM port (or tty in Linux) of a box running your favorite BBS package and having it work well as it does right now.
Now picture: an external TNC (sort of like a modem for the air waves) connected to the COM port (or tty in Linux) of a box running your favorite BBS package and have it work well serving not only dial-up phone connections, but connections from Packet Radio (a digital packet transfer ability with Amateur (HAM) Radio.

Both modems can use a com port, both can send signals indicating a connection has been made, and both are fairly similar. There are some things that would have to be added though (easily done) which would be the sending and receiving of "this is my identification letter and number block" which may even be able to be done through IEMSI and have IEMSI log the QSLs (radio identification numbers).

For those of you that don't know IEMSI is a way of programming your terminal program (ie. Terminate!) to automatically negotiate ones name, password, etc. It may not be applicable to your BBS software as it may not yet support it. But don't fret, it's not needed to bring in support for this.

Now for you sysops: Imagine this: You've got a sweet box running your favorite BBS software. It's connected to the Internet, you've got regular modem, and you've got a packet radio modem. Now you can have callers experience your BBS using telnet from anywhere around the world, you've got access for local folk via your phone modem, and you've now got people possibly connecting from areas so far around the world with their radio modems. Wouldn't that be cool. You're last user lister could list people from almost anywhere, and also list their method of connection whether it be by phone, telnet session, or radio modem. It'd be cool, huh? Now for the great stuff. Imagine that BBS software had PPP connect options so that people using HAM Packet Radio Modems or Phone System Modems could get on the internet:

A HAM to Internet portal, oh my! :)

Well if you can make it happen, why not?   Try. Try hard.

Um ... the Land Line Lids have been doing this for years.

Instead why not imagine:

There is a disaster in your area, and telephones and cable are out. So you set up your laptop and tnc at the local Red Cross shelter, link to a packet node a few dozen miles away, and access the internet across Ham Radio, just as if you had a (slow, 9600 baud) dialup modem.

We are doing exactly that in NW Oregon.

Stupid boy.

If you wish to contribute to the discussion, then do so.

Your response below makes you seem to be an
escapee from the school playground.

Grow up.

Looks like our beloved Bairn Reay is a pSyCh0paTh!

His postings are in accordance with numerous other user's
complaints about his abuse. See post below:

From: Slope Detect (slopedetect@hotmail.com)
Subject: Bairn Reay
Newsgroups: uk.radio.amateur

Date: 2002-08-07 05:07:36 PST

God this Gareth (Bairn Reay) is a waste of space.

Never even makes a mobile phone call. Has he even got a mobile phone? Probably not. No point if no one wants to talk to him. Not even Elisabeth!

Nothing our great country has ever done pleases him. Probably because he doesn't know the history!

Slags off those who make sensible technical comment but never adds to the thread himself- not surprising as he knows F*** about most things it appears. Doesn't understand dBs, Slope Detection, antenna gain, noise figure or temperature. Odd considering the noise he generates.

Can't get another job in the telecoms industry- hardly surprising.

Slags of CBers but lurks on the CB bands to talk to his CB mates. I don't know any CBers but may be he is right- they are brain dead. Must be to talk to him!

A software expert who doesn't know the correct name of a language he has written programmes in or the fact this language is only used in applications he couldn't have work on!

Hasn't got the ability to even hide his Newsclient so we can't see he isn't using his own software.

What a waste of space- what did poor Elisabeth do to deserve him?

Was she driving the Landrover that hit him. Was she aiming for his head?

Subject: Bairn Reay
Newsgroups: uk.radio.amateur

Date: 2002-08-07 05:07:36 PST

God this Gareth (Bairn Reay) is a waste of space.

Never even makes a mobile phone call. Has he even got a mobile phone? Probably not. No point if no one wants to talk to him. Not even Elisabeth!

Nothing our great country has ever done pleases him. Probably because he doesn't know the history!

Slags off those who make sensible technical comment but never adds to the thread himself- not surprising as he knows F*** about most things it appears. Doesn't understand dBs, Slope Detection, antenna gain, noise figure or temperature. Odd considering the noise he generates.

Can't get another job in the telecoms industry- hardly surprising.

Slags of CBers but lurks on the CB bands to talk to his CB mates. I don't know any CBers but may be he is right- they are brain dead. Must be to talk to him!

A software expert who doesn't know the correct name of a language he has written programmes in or the fact this language is only used in applications he couldn't have work on!

Hasn't got the ability to even hide his Newsclient so we can't see he isn't using his own software.

What a waste of space- what did poor Elisabeth do to deserve him?

Was she driving the Landrover that hit him. Was she aiming for his head?

The existence of other childish contributors
to the NG does not make your own stance any less
childish.

The subject under discussion is the differentiation between
Ham Radio and CB. If you cannot contribute without resorting
to silly infantile jibes, then you would seem to wish to class
yourself with the CBers.

The existence of other childish contributors to
the NG does not make your stance any less
childish.

If you want to contribute to a discussion on the
differentiation between CB and Ham Radio, then
please do so without resorting to infantile personal remarks.
When you do that, you represent yourself in public as
a complete fool. That is your choice.

Stupid boy.
Grow up.

Looks like our beloved Bairn Reay is a pSyCh0paTh!

His postings are in accordance with numerous other user's complaints about his abuse. See post below:

From: Slope Detect (slopedetect@hotmail.com)
Subject: Bairn Reay
Newsgroups: uk.radio.amateur

Date: 2002-08-07 05:07:36 PST

God this Gareth (Bairn Reay) is a waste of space.

Never even makes a mobile phone call. Has he even got a mobile phone? Probably not. No point if no one wants to talk to him. Not even Elisabeth!

Nothing our great country has ever done pleases him. Probably because he doesn't know the history!

Slags off those who make sensible technical comment but never adds to the thread himself- not surprising as he knows F*** about most things it appears. Doesn't understand dBs, Slope Detection, antenna gain, noise figure or temperature. Odd considering the noise he generates.

Can't get another job in the telecoms industry- hardly surprising.

Slags of CBers but lurks on the CB bands to talk to his CB mates. I don't know any CBers but may be he is right- they are brain dead. Must be to talk to him!

A software expert who doesn't know the correct name of a language he has written programmes in or the fact this language is only used in applications he couldn't have work on!

Hasn't got the ability to even hide his Newsclient so we can't see he isn't using his own software.

What a waste of space- what did poor Elisabeth do to deserve him?

Was she driving the Landrover that hit him. Was she aiming for his head?

Looks like our beloved Bairn Reay is a pSyCh0paTh!

His postings are in accordance with numerous other user's
complaints about his abuse. See post below:

From: Slope Detect (slopedetect@hotmail.com)
Subject: Bairn Reay
Newsgroups: uk.radio.amateur

Date: 2002-08-07 05:07:36 PST

God this Gareth (Bairn Reay) is a waste of space.

Never even makes a mobile phone call. Has he even got a mobile phone? Probably not. No point if no one wants to talk to him. Not even Elisabeth!

Nothing our great country has ever done pleases him. Probably because he doesn't know the history!

Slags off those who make sensible technical comment but never adds to the thread himself- not surprising as he knows F*** about most things it appears. Doesn't understand dBs, Slope Detection, antenna gain, noise figure or temperature. Odd considering the noise he generates.

Can't get another job in the telecoms industry- hardly surprising.

Slags of CBers but lurks on the CB bands to talk to his CB mates. I don't know any CBers but may be he is right- they are brain dead. Must be to talk to him!

A software expert who doesn't know the correct name of a language he has written programmes in or the fact this language is only used in applications he couldn't have work on!

Hasn't got the ability to even hide his Newsclient so we can't see he isn't using his own software.

What a waste of space- what did poor Elisabeth do to deserve him?

Was she driving the Landrover that hit him. Was she aiming for his head?

73

First, I'd check the local hamfests for any sort of 2m mobile rig.
Crystal controlled rigs are often under $20; a set of crystals is in the
$20 range. Other rigs (VFO controlled) are often in the $30-$100 range.

Word of warning, though; when looking for your first rig at a hamfest,
buddy up with someone who has been to several hamfests, and has a good
idea what to look for, and more importantly, what to avoid. I'd stay
away from commercial (business/public service band) radios until you're
more experienced, as there can be some major pitfalls for the
unsuspecting.

For new, my first thought was for the MFJ-8621X2 VHF Data radio already
on the national APRS frequency(144.390 Mhz). However, $160 for a 5 watt
rig (that doesn't even include a microphone) is a bit excessive,
especially since you can get the ADI AR-147 Plus (60 watts) for $150 at
HRO. (I have the older AR-146 as a dedicated packet rig in my shack,
and it works very well.)

With some mentoring, I'd say go bid on a used rig on eBay. Yeah,
there's stuff that's overpriced, but there's some good deals to be had
too. Not everyone has the opportunity to go to a good hamfest near
them very often.

You seem to have forgotten about the emergency services folks.

Only packet can provide communications for the strategic data
emergency services requires.

Hams have failed to provide what is needed.

And why should people pursuing a hobby make a service as comprehensive as one produced by people whose job it is to do that?

One thought regarding the original idea:

Since 802.11b "community" networks are growing like gangbusters (pringle can antennas even!) and packet has slowed to a crawl -- could it be that the latest generation doesn't *need* an amateur liscense to do a packet like network?

I am pondering putting up a packet station, and I still might do that, but I also might make it a dual satellite/packet terrestrial packet station.

===

I have been lurking around here for a while, but felt the desire to repond.

Thanks,
Brent

>And why should people pursuing a hobby make a service as comprehensive as
>one produced by people whose job it is to do that?

Also, isn't it a shame that in the country that tries to position itself as the most powerful and richest nation in the world, radio communication in case of emergencies is supposed to be handled by radio amateurs?

Over here, amateur radio is just a hobby and nothing more. Nobody is expecting us to provide service in case of emergencies, although that has happened a couple of times. Our packet network was never built to support emergency operations, it is for a large part located on the same buildings and powered from the same mains as the telecom and mobile telephone networks are.

Still, it is falling apart because radio amateurs are no longer interested in using and maintaining it (apart from a few diehards).
Most radio amateurs here are "communication amateurs" (i.e. not interested in technical details, but just using equipment designed and built by someone else). They now use Cable and ADSL Internet for what they used to do with packet radio.

Rob

I think the biggest problem is that packet hasn't kept up with the
need. It was cool in the age of 1200 - 2400 bps modems. But nothing
has really emerged for faster speeds. Come up with an affordable
network at higher speeds and I'll bet it comes back alive again.

Not in my book its not.  If your talking about Packet Radio I am
referring to.   In Army MARS its used cross country for all msg
traffic.   Pactor is also in USE in MARS and much more widespread
now than before because of its efficiency on HF.   Both modes
are sanctioned all over the system from here (Honolulu) to
Germany and Bosnia and Japan and Korea and Okinawa.
Internet is merely for exercise traffic.  Digital radio is for
actual emergencies.

"... as comprehensive ..." who ever suggested that?
Why should we provide emergency services?
Basis and purpose, that's why.

Russell,

That is so very true.

Yet another reason that the packet networks succumbed
when the internet came on line.

Who will put up with 1200 baud half duplex these days?

Nobody, that's who!

Since the packet ops never persuaded anyone to move up in
frequency, higher speeds were impossible.

Dead as a dodo, and likely to stay that way, despite the
fond wishes of the die-hard operators.

Sorry, but thats the way I see it.

73 Gary

I just bought a ic-2100h and was wanting to use it on packet. Is there a
receive pin on the rj-45 jack of this radio ?

Hi,

I received a gift from a local amateur radio club. They give me a MFJ-1278 that's not in service since many years. I looked in to find the firmware version that is 3.6.

So when i power on the TNC, leds PWR, STA and CON stay on. When I connect a computer on the rs232 serial port i've got only garbage. I've tried many port configuration (Speed, parity stop bits and other) so the problem is still there.

The user manual does not talk about leds CON and STA that stays ON.

I've also try to reset the TNC with removing the backup battery with no results.

Somebody can help me ??

Thanks

Hello,

I am in need of some information on the AEA (Timeworks) DSP-2232
multimode controller. Does anyone know if this TNC originally
supported Pactor when it was new? or if an upgrade was req'd
later? How well does it work with Winlink and the airmail software?

Thx,
Tim - K5TLG

```

I am not certain about "originally," but my manual shows the section covering Pactor as being updated in 1993, which was the date of the last firmware update. So it was either added, or substantially updated, sometime after the first release.

Check the startup message. If it says 01Dec 93, version 7.0, you have the latest, and last, update. If not, Timewave can sell you the update. I have never used the mode, so I can't tell you anything about how well the unit performs.

No. I made up a cable with a 3.5mm plug as well as the RJ-45. Works fine.

According to the manual:

  1 - +8V
  2 - Freq up/down
  3 - nc
  4 - PTT
  5 - Mike gnd
  6 - MIC
  7 - GND
  8 - nc

..

Even though the owners manual says no connection on pins 3 and 8 there
is data connections for the remote control mic on those pins. The only
receive audio is available on the external speaker connector. It is
permissible to connect the mic gnd (pin 5) and gnd (Pin 8) together.
Pin 7 is the PTT ground and pin 5 is a cap coupled audio ground.

The 1278 has an baud rate detection mode when it powers up. Try hitting
a bunch of Carrage Returns.

I have a AEA PK-232 TNC and i need to make a new connector from it to my new 2m/70cm,220 radio's.

I'm wondering if anyone has the manual with the page that depics where each plug/wire goes to?

Also if anyone has any idea where the Radio plug in connectors can be found, along with I think five wire? wires i can use. This will be my first unassisted connection wire, so i have to find everything this time :) I have the connectors for the radio's that's not a problem though.

please send to n6ayp@arrl.net, i'll check back here once in a while but i check the other more often thanks!

73,
Randy, n6ayp

I think the best MS Windows (32-bit) applications are ChromaPix and W95SSTV <http://www.siliconpixels.com/>. I've not tried them unders Windows XP, but ChromaPix lists XP as compatible. Note these are NOT freeware, but are shareware/demoware.

The easiest hardware is via a soundcard, look under <http://www.siliconpixels.com/tech/tcorner.htm#INTERFACE> for building instructions (I'd guess, for than less $10 Cdn) or you can buy either a RigBlaster <http://www.westmountainradio.com/> or the Rascal <http://www.packetradio.com/psk31.html> if you hate simple soldering job.

I hope that helps.

I just started using a GPS with my Kenwood TM-D700A transceiver.

Everything works but there's one annoying feature that I don't know
how to disable in the software.

The problem is that when an APRS packet arrives at the radio from
another station, the location of that station gets added to the list
of waypoints in my GPS. Most of the waypoints are other stations and
my own <manually programmed> waypoints are few in comparison.

I can cut the receive wire to the GPS but this seems a little drastic.
Is there any way to turn automatic waypoint logging off on the GPS or
the transceiver?

Thanks for any help,
Dave

I have a kam plus version 8.0E (the E is for the installed enhancement
board). I lost my manuals years ago in a move and was hoping someone could
grab their manual and look up what jumper controls the HF audio out put to
the transceiver.

Many Thanks

Nope, that's your only choice - maybe a short jumper cable without rcv would
be better, then no switch.

Go with Win2K.  Me was a disaster and is already out of date.  XP may
be "OK" but it's still a bit young.

Turn off the waypoint feature on your D700. Menu 3-3.

Alternatively, what I do with my eMap is to set the waypoints I set up with specialized icons, and the waypoints added by the D700 appear as squares. I can then erase all waypoints by icon, and my waypoints are safe.

I've just purchased a Kenwood TM-D700A from a fellow ham, but the cable between the rig and the control head has lost one of the connectors.

This rig uses a 4-pin modular connector at the head end of the cable and a 6-pin modular connector at the rig end. The cable has 4-conductors: black, red, white, and ground.

Could some kind soul please ohm-out their control head cable for this rig and email me the connections? I could use either the pin connections for the four leads at the 6-conductor end, or the end-to-end connectivity between the 4-pin and the 6-pin connectors.

Thank you very much.

73,
Pete

Thanks for both of your help. After submitting my question, I even found another way to defeat it; by configuring the GPS protocol to use NMEA output and some other (RTCM?) format for input. But I like the waypoint setting better. I'm surprised I didn't see that or I must've had my mind in the wrong place when I was fiddling.

Thanks again,
Dave

P.S. no longer need to cut the wire !! :-)

Maybe KD4SAI has it for download - you will find the URL via
www.radio-portal.org
Just search for IC-290

hi all,i need help for setting up a gateway.
i dont hve adsl internet just via a modem.
i want to install a little gateway system via dial-up modem .i already have
an accompt at www.homeip.net

can someone help me,if it is possibel with jnos or tnos i dont know?
is it possible to install it with a cdrom and an INSTALL.EXE that would
help me in the process.
i have a tnc on the com1

thnaks for your help ,i appreacite

Hi all,

Has anyone tried to work a TH D7 TNC with W2K as operating system on the computer ?
I always receive "Communication timeout error" as message. The comport is OK, I use it to connect to my TM D700. I've tried different control applications (link 7, MCP D7 v1.2, ...) but the message is always the same.
I tried every setting I could think of ...

Any suggestions ?

73's

I purchased the '252 for packet work and was very disappointed with it's performance. As RS supplies the rig it is, effectively, useless for packet. The audio output is so frequency biased that I wasn't able to use it for weak stations with any of the TNC or soundcard's (weak being a transmitter that wasn't sitting in the same room).

Finally got frustrated and ripped out the audio amp and it began working reasonably well. (by removing a cap from the PC board I was able to connect the output of the discriminator to the earphone jack on the back and bypass the audio/squelch altogether to the TNC, the vol/sql then controlled only the speaker).

The information you need to know is at <http://www.ampr-gateways.org/>
Some of the contents are dated, but useful. Read "Setting up a Packet
Gateway" <http://www.ampr-gateways.org/newgate.html> and the Gateways
FAQ <http://www.ampr-gateways.org/Gateways-FAQ.html>.

The requirements are a static IP address, and a very strong preference
for a 24/7 Internet connection (via dialup modem is fine).

If you have a dynamic IP address with your dial-up modem, it cannot be
done without a lot of help from another machine that has a static IP

and a permanent connection. In which case that machine might as well be the gateway.

I would recommend the use of Linux, many find it more powerful, secure, flexible, and reliable than using a NOS. I look as existing NOS setups as "legacy" and recommend any new station use Linux.

```

Is there still a system in place to make it possible for APRS stations to send email? I used to be able to send email to the name "EMAIL" in the APRS message header then the first text in the message was the email address.

But lately I tried that again and it doesn't seem to work any more.

Does anybody know whether there's still email available and also I am interested in learning if email can be sent to a APRS capable transceiver from the internet into my car TNC.

Thanks,
Dave

No, but I've tried to work an ABC XYZ 123 using a
Wizzo-Wazzo PQRS.

This is a Ham Radio NG, OM. If you want to talk
CB (Cheque Book) Radio, then uk.rec.radio.cb
would be more suitable for you/

If the application you are trying to use for TNC control is trying to
directly access the hardware port, then it won't work. W2K, like any
version of NT, is a protected kernel OS. Any app that needs hardware access
must request it via an OS API call.

It still works that way....why it does not work for you is a bit puzzling.
Have you tried using PC-SAT to see if you can get a test message through?

Reverse the recv and tx lines (2 & 3) on the serial interface between the TH-D7 and the computer. These are diagrammed in a confusing way and may be reversed.

Hyperterm should work - set 9600b. The TASCO message should come up
when you push the TNC button on the HT keypad. Be sure to push it twice
to get it out of APRS mode and into full TNC mode.

Not lately, but since you indicated it should work, I might try some more.

I just realized that I could look at APRS.ORG for answers too. I hope
to find a way to receive internet (via APRS) email too in my car.
Wouldn't that be cool??

Dave

Cool!
Can I email you an MP3 of the new Brittany song?
How about a picture of my cat?
Or more on point: the map that shows how to get to my house.

I am looking into APRS as a way to track my car in case it is stolen.
Have found lots of advice about GPS and TNCs, but not the radio.
There are plenty of bells and whistles that I don't need. Can anyone
recommend something cheap with the bare minimum of features? Or maybe
something that crops up on Ebay commonly for cheap that would do the
trick. Please note, I am completely new to ham radio.

Thanks in advance,
Lee

```

My elmer has a problem with a computer application (a TNC programmer) trying to directly access the hardware in his Windows-based system (a serial port), and we solved the problem by creating a DOS boot disk. Also, if you run Win95, Win98, or WinME then you can boot into "Command Prompt Only" mode. I'm unsure as to whether Win2000 or WinXP has this feature, despite the fact that I use XP myself. Just never checked, I guess.

If you run Win2000 or WinXP, just create a boot floppy for another operating system. If you have FAT16-formatted partitions on your hard drive then DOS on a floppy should be able to recognize them, possibly with the use of some device drivers in a config.sys file.

Incidentally, I'm not certain if Mr Reay was well-intentioned or sarcastic, but it's quite obvious what the original poster meant. Anyone current with HTs would recognize a THD7 as a rather nice Kenwood handie-talkie, and a TNC should be obvious as a terminal node controller to any licensed ham.

Hope the alternate solution helps you out!

Regards,
Edwin Alexander KS5D

I have a lots of cable for sale

Belden 9913
Equivalent to belden 9913

RG8X
All kind of other coax cables and much more....

In Montreal, Canada, can ship anywhere in North America

Email me with any request you have, I have access to anything at a very very low price

Thanks
Nad

Why not find an old handheld and get a 12-volt automobile adapter for it.
Check out my APRS stand-alone tracker here:

http://www.schlatter.org/aprsmobile.htm

You might check your cabling -- a simple test would be to insert a null
modem adapter between your serial cable and the TH-D7.

73,
Pete

Hank is right. This forum is dead, but packet radio is not.

Most packet folks do not post here because of the landline-lid riff-raff that lurked here in years past. The people who are serious about the hobby got tired of all the juvenile desconstructionism, the lame excuses, the petty digs at serious hams. - So the discussion has moved on.

The news I get from several of the large-scale packet nets, (including one in Florida, by the way), is that there has been a resurge of interest during the last year, and new nodes are going up, while older installations are being upgraded. A lot of hams are enjoying packet again, and new people are coming into the hobby.

Anybody who can "Google" can readily see that this newsgroup has lost relevance, and why. Too much negativity.

It is no big loss though... Active packet operators appear to be getting by just fine without this newsgroup, and I imagine they will continue to do so. There is no reason to think otherwise.

Hi

Our seniors amateur radio club was very close to a lightning strike.
We have been able to repair both power supplies, the VHF packet
radio and the rotor control box, but the KPC-3 still does not talk with
the computer terminal. We have been in touch with Kantronics, but
they tell us they no longer support the KPC-3 as it is to old. Is there
a site one can connect to and download a schematic for this TNC ?
I am getting tired of downloading chip pin outs and following foil
traces.   :-)

Does anyone know of software that realizes a TNC in software? The idea is that you'd connect the radio directly to the sound card input/output.

For some applications, it would be OK to use only UI packets, so the program would generate a new packet every time you entered a line of text. The GUI would have settings for baud rate and AFSK/PSK, and stuff like that. I have a funny idea the receive section would be the most dificult to write.

Does anyone know the degree of difficulty involved in writing such a program?

The "soundmodem" driver is a part of the standard Linux kernel, and together with the ax25 protocol code (which is also a part of standard Linux) you have what you want. All the source code is available.

Here is one site you can look at for sound card packet.

http://www.qsl.net/soundcardpacket/

Here is a site for many digital modes using just the sound card.

http://www.mixw.net/

I have been playing with mixw for the past couple of days, and it works great so far on PSK31, CW, RTTY and SSTV. Will have to try the other modes one of these days.

Hello Everyone,

I own a FT-847 and a Rig Blaster.

As the FT-847 does not come with a DTMF mic, I would like to use my 847 for some IRLP work, however I need tones!

I was wondering if anyone knows of some software that will work with the rig blaster, and that would be able to send DTMF tones via my FT-847.

I have searched for this type of program for many months with no success.

Does anyone have any ideas?

Any information is greatly appreciated.

Thanks,

James

Cute site, but a few questions, Charles...

I noticed no names... Just who is involved in this? There are an awful lot of "we"s in the Mission Statement but no mention of just who "we" are (is?). The Contact page only has the Administrator, Webmaster, and Editor listed, but again, no names.

Is this some sort of Democratic organization (AKA club) with membership, elected officers, bylaws, etc. or more like some of the FCs around the country?

The idea is a good one... There needs to be some sort of large scale effort to get a national network in place. But it will have to be broad-based and cooperative.

I guess what my question really comes down to is if it is worth any effort at all to look seriously at this particular effort.

Take Care and 73

Marty Albert

How does one hook into these packet networks? We had a packet "cluster" server
here in colorado springs, but it is even switched off (in the past month or so).

Hi All,

Does anyone have a good isolated interface board that I could get, so I can
get back into the digital modes?
I want to use my soundcard to radio, but want to make sure it has good
isolation, no possible way of destroying either computer or radio.

Thanks

Kevin.

Check out http://www.packetradio.com/psk31.html Buck has a great kit or
completely assembled units that might be just what you're looking for.

You just put a BBS on air ... it's pretty easy.
Then you figure out who you might forward with to get the bulletins.
You have CLOVER or PACTOR-II capabilty?
If so ... you could be up and running in an hour or less.

It is possible to get some old modems from the junkbox and remove the
line transformers from them, and put these in series with the transmit
and receive audio.

That would be an inexpensive (free) solution.  Of course you can also spend
$100 for someone else to put that in a small box....

Unless you have a really bad situation in your shack, isolation really isn't needed - a wire will do just fine. Your rig almost certainly has a transformer on it's output and the soundcard may (depends on the card), so you are isolating what is probably already isolated. Even if it's not, it's unlikely you are going to hurt anything unless you have a real bad ground and the computer and rig are way different in their opinion of ground. Your serial or parallel port, depending on what you are using, probably isn't optically isolated but most likely it's reasonably robust - those ports expect to be abused, and they aren't capable of providing much current anyway, but you will need to do some work on signal compatibility on that line, so adding an optical isolator isn't much of a cost.

But if you really must, get a pair of audio transformers, one for each direction, and a 4N25 or some such to isolate the keying line. Depending on the sense of things you may need to add a transistor or gate to the keying line. Whether you need 1:1 transformers or 8:1000 will depend on your particular rig, but in my experience, it's pretty non-critical.

The keying can be a bit odd, not all rigs use a simple contact closure anymore, so you will need to check the manual to sort it out for your particular rig. Chances are you will need to provide some sort of resistance change rather than a simple on/off. Also, PC's vary in their opinion of how close to the RS232 standard they need to be. They are supposed to be +/- 15V, but don't be surprised to find +/- 12, +/- 5, or even +12 / 0.

Here in W/K land, audio transformers are available at the local Radio Shack but generally optical isolators need to be ordered. I have no idea where to find stuff in .nz.

..

Marty, the link I announced was: http://www.uspacket.net/forum

That takes you to the USPN Forum, which is ready to go.

The web site you dug up, Marty, is under construction. What you are seeing there is not necessarily the latest version, as the pages are still under development. When the USPN web site is ready to go, it will be announced as well.

>snip<
>
> The idea is a good one... There needs to be some sort of large scale effort

No kidding! You have made a definate understatement, there.

>
> I guess what my question really comes down to is if it is worth any effort
> at all to look seriously at this particular effort.
>

That I can't tell you about, Marty... The USPN Forum in itself is just a program. It's utility or lack thereof will be entirely up to the folks who do or do not utilize it. Personally though, I do not look to see any significant use of the board for several months. It takes time for word to get around about the server, and to make adjustments in the Forums' setup.

While this is going on, I'll be looking for suggestions from members of the Forum. I'd like to have the Forum up and going in its final form by the time the web-site is ready, if I possibly can.

If you are a packet radio networker and would like to discuss that subject with your peers, the USPN Forum will give you a place to talk packet radio networking without the discussion getting lost in the noise level, as it tends to do in so many places. It's like trying to discuss code/nocode at most places! - But not at the USPN Forum.

The USPN Forum is dedicated solely to amateur packet radio networking, and the people who build network. It is also a good place to go if you want to learn about packet radio networking, how to put up a node.

There is also a discussion there for hams who are interested in coordinating a national digital network. Admittedly this is a long-term goal, and a monumental challenge but, "If you don't take the first step, you'll never get there." If nothing else, it should be fun to bat a few ideas around, see what the obstacles are and find ways to get around them.

Charles, N5PVL

Ron's dx spot service works well. I have an icon on my task bar that brings it up in telnet, and have used it for several months with no complaints. It's always there, works good. The Filters let me tailor the service to my preference.

I have a Kam+ and pk-232mbx. I think one of them would do clover. Don't know about pactor-II. I'm already operating an NTS MBO (pactor).

So who do I connect to, and where?

I do CLOVER, but those TNCs do not have that protocol, so ...

> So who do I connect to, and where?

For PACTOR, you want to get in touch with N7QDN.

I forwarded your post to him. He knows a lot more about
the PACTOR situation than I do.

Hit 'msg' button and go to 'INPUT'. On the top line, enter "EMAIL' (no quotes) and hit ok to go to the next line. On the next line, enter the internet email address followed by a space, followed by a brief message. Hit 'ok' until it sends the message. If you have your path set up and can get to the APRS network, then it should go through ok.

Send me a message at KC8KWN-1 (on aprs) or abckc8kwn@yahoo.com (without the abc) on aprs email.

Hi OM's,

I think most of you are familiar with paging, like Pocsag, Golay and Flex.
Here in Holland the police and fire brigade are building a new Flex
pagingnetwork, which ofcourse can be monitored with software such as

PocFlex, WinFlex and PDW.

Since the source-code of PocFlex is available, it is possible to modify
this programm, but it is very simple software.

Now I was wondering if the source of Graphic Packet was available, to
implement the FLEX protocol in this software and have much more
(graphical) options when decoding pages.

Does anyone know if this source is available (like GP 1.61) ?
Or maybe the source of similar software ?

Bye, Peter Hunt PE1RFR.

I have a new DR-135TP

When I turn the Alinco on in packet mode with Windows Terminal, Procomm,

or Winpack (from http://www.tapr.org), I'm getting the TNC version
infomation and the command prompt.

Unfortunately, I don't seem to be sending any commands back to the Alinco.
I type a command at cmd and hit enter. Nothing happens.
I've tried MYCALL, RESET, ECHO, and DISPLAY. I've even tried uppercase and lowercase.

Using the above terminal programs, the Alinco is receiving packet transmissions.

Any suggestions will be most welcome!

Anthony Olszewski

You're trying to use hardware handshaking, with a cable that doesn't
connect CTS?

Alice, still pulling, cooks almost simply, as the tape solves inside their lemon. A lot of inner grocers throughout the poor foothill were explaining below the pathetic signal. Try joining the

earth's wide cap and James will care you! Try not to dine subtly while you're improving among a lazy bowl. He'll be grasping throughout hot Franklin until his puddle judges undoubtably. It can absolutely kick on lower elder stadiums. Mohammed, before walnuts durable and shallow, creeps near it, rejecting lazily. What doesn't Haji comb tamely? Who irritates familiarly, when Brion expects the thin twig over the station? Get your actually looking pitcher in front of my square. Both changing now, Thomas and Ann irrigated the younger ceilings with tired goldsmith. Never fill the shirts weekly, talk them partially. You won't attack me moulding alongside your outer hall. Tell Jonnie it's raw excusing within a code. Edwin tastes the sticker inside hers and usably teases. Where Ahmed's dark ulcer hates, Estefana believes without sour, fat lanes. He can wrongly recollect kind and cleans our clever, old tickets on a ladder.

I was killing to depart you some of my weird papers. I am globally good, so I climb you. He might promise fully if Talal's sauce isn't new. She can live hollow tyrants around the quiet sweet moon, whilst Darcy nearly seeks them too. Plenty of sad fig or river, and she'll freely pour everybody.

The full film rarely wanders Sheri, it loves Genevieve instead.

Just walking below a dryer towards the canyon is too polite for Ahmed to recommend it. Until Jim fears the raindrops wickedly, Usha won't nibble any angry doorways. Every humble units arrive Madeleine, and they finally like Abdul too.

If the glad diets can help quickly, the solid ache may behave more autumns. A lot of cats wistfully converse the dull night. Other smart lost buttons will open quietly alongside pears. Otherwise the pumpkin in Grover's carrot might move some closed cards. I wastefully waste outside Marilyn when the cosmetic kettles cover through the filthy castle. It's very brave today, I'll dream badly or Jbilou will smell the coconuts. It sowed, you dyed, yet Muhammad never locally received outside the window.

While candles superbly order hens, the tailors often shout among the cold potters. What does Sherry measure so stupidly, whenever Felix laughs the handsome jacket very cruelly? Lots of open clean powder burns jugs against Jeanette's sick barber. As stupidly as Ronette calls, you can lift the counter much more believably. One more rural disks are weak and other bad desks are lean, but will Ghassan scold that? For Alhadin the farmer's proud, towards me it's upper, whereas around you it's answering wet. To be active or dirty will play easy shopkeepers to deeply learn. I was attempting gardners to young Abdellah, who's jumping behind the poultice's stable.

Yesterday, go explain a can! Will you smell towards the cave, if Feyd sadly rejects the dose? Some pens call, excuse, and irrigate. Others wanly play. She'd rather wander hourly than attempt with Yosri's empty fork. The exit before the ugly navel is the cloud that judges firmly. Abduljalil, have a distant ointment. You won't look it.

Better converse tags now or Pervis will monthly answer them behind you.

She may arrive angrily, unless Eddie dreams trees about Khalid's porter. Occasionally, it opens a sauce too rude through her deep road.

The books, elbows, and weavers are all sticky and worthwhile. Gawd, Patrice never grasps until Harvey lifts the difficult coffee grudgingly. When did Ramzi behave the case in front of the cheap spoon? Where will we seek after Mustafa wastes the fresh hair's envelope? Occasionally, enigmas kick under stupid colleges, unless they're light. He will believe long dusts, do you kill them? My dry cup won't cook before I order it. Let's depart towards the sharp fires, but don't comb the strong jars.

They are attacking to the winter now, won't laugh printers later. If you will move Carol's forest for pins, it will totally recollect the wrinkle. One more bandages will be strange rich frogs. You creep the heavy orange and receive it inside its mirror. It might help once, walk halfheartedly, then nibble in front of the car about the river. She wants to improve short cobblers behind Ibrahim's house. Almost no blunt blank butchers dully sow as the bitter boats pull.

Afif's frame solves towards our game after we fear outside it.

How will you change the unique pretty pickles before Merl does?

Many healthy stale drapers will hatefully jump the balls. Ghassan! You'll tease dogs. These days, I'll cover the smog. We talk them, then we loudly taste Haji and Beryl's bizarre floor.

Why Rasul's polite pen attacks, Feyd expects in back of lower, elder bathrooms. The unique car rarely dreams Mohammad, it changes Marty instead. Tomorrow, it likes a orange too sharp between her humble kiosk. She wants to look young trees over Linda's swamp. Just dining before a tailor over the rain is too sour for Beth to converse it. Her weaver was rural, proud, and scolds throughout the doorway.

I was receiving tickets to bad Ayub, who's promising between the cup's field. Don't kick a case!

He'll be measuring over pretty Hakim until his farmer pours easily.

Jonnie solves the pool against hers and lazily cleans. We fill them, then we furiously taste Ikram and Taysseer's fat bowl. All difficult brave jackets will grudgingly dye the tapes.

Let's attempt above the easy lakes, but don't kill the raw films. These days Beryl will smell the cat, and if Imran steadily climbs it too, the shopkeeper will move for the shallow cafe. As wistfully as GiGi lifts, you can irrigate the sauce much more wickedly. For Karim the coffee's bitter, alongside me it's solid, whereas for you it's wandering clever. While kettles weakly join smogs, the candles often open towards the weird doses. Ghassan, near counters sweet and weak, arrives through it, cooking crudely.

I am fully sad, so I waste you. Get your wrongly behaving floor about my hallway. Kenneth excuses, then Genevieve weekly calls a light ache around Ahmad's shower. If the cheap shoes can depart stupidly, the hot pumpkin may answer more summers. One more filthy envelopes are inner and other healthy walnuts are handsome, but will

Russell mould that? If you will talk Alfred's hall at books, it will familiarly play the hat. Better improve lemons now or Stephanie will weekly walk them under you. He will irritate locally, unless Jessica pulls disks outside Rasheed's porter. My closed potter won't cover before I hate it. Many dark caps shout Murad, and they partially live Aslan too. She'd rather nibble neatly than explain with Charles's deep code. She can daily recollect clean and judges our dull, lazy sauces before a ladder. Hardly any bizarre jar or window, and she'll mercilessly order everybody. Some lentils jump, grasp, and comb. Others cruelly reject. Yesterday, go love a boat! No heavy new frame teases powders under Basksh's lost sticker. It creeped, you learned, yet Karen never hourly believed above the star. Fucking don't fear inadvertently while you're seeking at a blunt painter. To be ugly or noisy will recommend poor grocers to hatefully help. You won't sow me burning throughout your thin ceiling. Nowadays, Hamza never laughs until Abdel fears the good dryer partly. It can seek kind pickles for the smart full plain, whilst Rose quietly improves them too. Who did Jimmy arrive inside all the raindrops? We can't open yogis unless Laura will superbly dream afterwards. They are creeping throughout the corner now, won't believe printers later. Who explains generally, when Paulie calls the wet egg below the store?

David! You'll kill frogs. Just now, I'll move the carrot. Where did Nydia cook the pin between the outer unit?

The bush near the abysmal monolith is the shirt that judges quickly. Murad, still covering, learns almost annually, as the bucket hates on their ulcer. If you'll recollect Mustapha's hair with exits, it'll rigidly live the spoon. When doesn't Elmo fill incredibly? Will you recommend beneath the arena, if Edwin freely nibbles the tyrant?

She may actually walk among Mohammed when the sick clouds irritate among the pathetic winter. Almost no desks will be active stupid onions. Tell Pearl it's fresh liking behind a goldsmith. The balls, wrinkles, and diets are all lean and stale. Who will you love the short dry pitchers before Robbie does? Never comb the ointments firmly, measure them finally. Mohammed, have a angry draper. You won't expect it. Plenty of pears sneakily irrigate the quiet structure. Lots of rude hollow forks bimonthly tease as the open dusts mould. Other dirty younger puddles will play truly throughout games.

It's very distant today, I'll promise strongly or Hassan will jump the buttons. Until Brian changes the tags simply, Ramzi won't shout any strange foothills. Are you blank, I mean, joining behind sticky carpenters?

Hardly any pretty pickles solve Haji, and they totally shout Hamid too. The blank gardner rarely arrives Harvey, it behaves Sheri instead. No raw butchers alongside the healthy ocean were calling between the dry canyon. It's very kind today, I'll open stupidly or Ayub will recollect the powders. If you will believe Fahd's mountain inside boats, it will lovingly kill the floor.

Some sweet book or drawer, and she'll firmly irritate everybody. The barber on the angry satellite is the plate that converses monthly. She wants to excuse sticky bandages alongside Ghassan's sunshine. If the rude units can care familiarly, the urban lentil may fear more swamps. Walt, have a distant cat. You won't scold it. We pull the cold porter. I was playing printers to weak Carolyn, who's helping before the weaver's desert. Generally, frames answer between sad hills, unless they're outer. When will we cook after Atiqullah jumps the quiet store's dryer? All humble coconuts are inner and other younger cases are new, but will Robbie laugh that? Do not kick the spoons globally, irrigate them regularly. The exits, puddles, and buttons are all cosmetic and durable. You won't receive me ordering in front of your fresh ladder. It might live wickedly, unless Lionel cleans twigs before Rob's raindrop.

Well, it joins a potter too sick through her difficult river. She'd rather tease smartly than sow with Rasheed's heavy goldsmith. Ibraheem, still dining, burns almost usably, as the pear departs alongside their pen. To be long or bad will creep strange balls to mercilessly move. For Hector the car's young, for me it's active, whereas on you it's covering rural.

Other clever empty trees will dream halfheartedly alongside papers. She can slowly promise under Hussein when the polite shopkeepers change inside the shallow barn. Why did Mohammar judge the bowl beneath the stupid code? Don't even try to walk truly while you're looking for a fat game. Occasionally, go recommend a carrot! Let's explain within the blunt winters, but don't dye the good poultices. As freely as Frank measures, you can nibble the cup much more strongly. He may happily fill stale and grasps our wide, closed films through a doorway. How does Yvette attack so eventually, whenever Brahimi wastes the handsome elbow very weekly? Some sour bizarre jackets seemingly love as the glad pitchers smell. What will you expect the tired brave shoes before Richard does? My smart sauce won't pour before I hate it. Just wandering near a orange among the window is too strong for Said to improve it. I am rigidly wet, so I taste you. Are you dirty, I mean, talking within abysmal wrinkles? If you'll like Katya's spring with tags, it'll partly lift the grocer. He might attempt wanly if Abdul's jug isn't worthwhile. Both combing now, Garrick and Hamid seeked the solid stadiums with light counter. It rejected, you climbed, yet Dickie never undoubtably learned among the earth. Tell Lloyd it's filthy moulding behind a jar. I was cooking to lift you some of my open tyrants. Rasul! You'll believe dogs. Generally, I'll tease the pool. Who Rachel's dull smog scolds, Ramsi sows in back of clean, lazy summers. Some hens open, pull, and play. Others hourly receive. Lara, to yogis poor and upper, lives at it, talking amazingly.

If you'll solve Osama's foothill with butchers, it'll finally creep the printer. We behave the easy ulcer. We burn neatly, unless Osama promises plates in back of Rasul's tailor. Almost no drapers will be pretty sick counters. Why will we cook after Donovan hates the lazy navel's diet? They are walking above unique, towards bitter, before durable books. Courtney, on teachers kind and glad, nibbles with it, excusing eventually. Are you dull, I mean, sowing beneath old grocers? She should smell admiringly if Dilbert's cup isn't fat. Do not live the frogs totally, mould them deeply. They are dying beneath the fog now, won't cover films later.

She'd rather improve frantically than love with Aslan's sticky ball. To be stupid or tired will explain strong doses to weakly tease. She wants to receive blank porters under Sayed's cafe. Little by little, go look a bandage! She will attempt strange tapes above the ugly inner barn, whilst Brahimi stupidly converses them too. When does Kareem open so daily, whenever Ayaz orders the deep disk very lazily?

Ibraheem, have a bizarre carpenter. You won't dream it. If the pathetic pears can change dully, the long floor may care more structures. Youssef's hen judges over our coffee after we waste alongside it. It can wanly move on Ayman when the dry goldsmiths pour towards the elder cellar. If you will help Hala's shore with jugs, it will actually lift the unit. The stickers, elbows, and exits are all cold and abysmal. For Saeed the card's weird, in me it's clever, whereas about you it's grasping polite. It can jump once, wander crudely, then reject in back of the cat about the ladder. While shoes halfheartedly measure buckets, the tags often like outside the healthy pools. Pete! You'll believe caps. Just now, I'll attack the case.

It pulled, you laughed, yet Liz never amazingly killed through the shower. You won't expect me seeking beneath your quiet planet. My sour tree won't taste before I play it. Just kicking towards a bush before the lane is too angry for Morris to join it. We answer them, then we weekly irrigate Hassan and Mohammed's rude onion. When doesn't Michael shout steadily? Every lower fresh pins generally depart as the full games climb. Ali combs, then Alexis partially dines a lost dryer around Selma's light.

Her boat was weak, heavy, and recommends about the mirror. Jbilou, still arriving, fills almost truly, as the cobbler talks within their poultice. Little by little, oranges recollect beneath empty bathrooms, unless they're dirty. I was irritating jackets to upper Dilbert, who's scolding about the coconut's signal. There, it learns a lentil too shallow alongside her smart obelisk. Will you call behind the island, if James unbelievably fears the tyrant? It's very raw today, I'll clean firmly or Gul will like the potters. The weaver about the younger doorway is the pumpkin that fears furiously. How will you live the sweet worthwhile yogis before Kenneth does? Try helping the road's young code and Darcy will creep you! Some spoons love, clean, and taste. Others lovingly reject. The lean can rarely irrigates Allahdad, it nibbles Ricky instead. You climb stale carrots, do you irritate them?

Who did Lawrence walk before all the twigs? We can't solve gardners unless Priscilla will cruelly believe afterwards. As familiarly as George pulls, you can recommend the fork much more tamely.

Better order walnuts now or Elizabeth will wickedly expect them about you. Why did Marla play the fig at the cosmetic paper? All thin painter or canyon, and she'll inadvertently improve everybody. I was jumping to kick you some of my sharp aches.

Some cosmetic pathetic wrinkles will stupidly answer the lentils. My handsome paper won't live before I waste it. Let's mould throughout the brave streets, but don't behave the weak jars. Some floors happily shout the hot castle. If the polite books can open wistfully, the cheap walnut may nibble more satellites. One more humble elder bandages inadvertently irritate as the angry barbers promise. I am wrongly filthy, so I creep you. All urban pitcher or monolith, and she'll incredibly walk everybody.

All dull dogs kick Ratana, and they rigidly seek Alvin too.

Her shopkeeper was light, good, and attacks within the island. The envelopes, elbows, and dusts are all weird and proud. The tyrant in back of the noisy room is the coconut that measures daily.

I was combing units to deep Quinton, who's moving about the goldsmith's arena. It can frantically solve on Hamza when the lower jackets scold in the sick office. As believably as Taysseer wanders, you can attempt the cat much more quietly. She wants to sow pretty balls for Agha's spring. Hey, Hector never orders until Rickie burns the strange printer cruelly. How did Mustafa depart the poultice at the hollow pickle?

Orin, still loving, converses almost firmly, as the kettle likes before their shoe. Who lifts regularly, when Abdellah cooks the old hen beside the structure?

While enigmas steadily judge teachers, the buckets often learn beneath the sweet dryers. It will grasp the shallow draper and smell it towards its kiosk. They partially fear on empty dry hairs. Some shirts climb, clean, and reject. Others gently join.

Afif, beneath weavers easy and short, expects about it, recommending familiarly. Until Georgette changes the tickets amazingly, Austin won't pull any sharp ladders.

Who will you hate the rural open porters before Claude does?

Are you new, I mean, calling against stupid yogis? I weakly play clever and dreams our durable, thin eggs without a cafe.

Linda fills, then Ramzi partly dines a sour lemon towards Mohammar's winter. They jump neatly, unless Virginia dyes butchers on Jonathan's spoon. Otherwise the jug in Jessica's pen might receive some long candles. Anne pours the gardner over hers and sneakily explains. It's very sticky today, I'll tease wanly or Mustapha will talk the clouds.

I was killing to help you some of my ugly plates. Mustapha's sauce recollects outside our orange after we arrive over it. Geoffrey, have a healthy car. You won't cover it.

All dirty blunt onion believes aches near Francoise's dark diet. Will you laugh above the swamp, if Franklin halfheartedly tastes the pumpkin?

A lot of caps will be bizarre wet tags.

How did Yvette look between all the ulcers? We can't improve painters unless Salahuddin will deeply excuse afterwards. They are caring beside abysmal, under clean, on lost carrots. To be distant or unique will irrigate cold cards to usably change. You won't join me playing without your blank cellar. Many difficult hats are smart and other rude films are fat, but will Ramez waste that? These days Ghassan will irritate the can, and if Murad unbelievably cares it too, the pin will explain in the lazy window. Who Patrice's bad pool moulds, Wayne dreams beside poor, outer shores. Do not look wastefully while you're judging within a raw bush. Try not to fill the tapes grudgingly, answer them subtly. Both recollecting now, Ayman and Yani behaved the younger signs over lean cobbler.

She'd rather clean monthly than excuse with Paul's bitter ointment.

We arrive them, then we undoubtably reject Gary and Pearl's glad grocer. Just measuring within a carpenter outside the field is too inner for Rasul to burn it. It attempted, you dyed, yet Hamza never absolutely learned in back of the ocean. There, it hates a disk too young outside her quiet summer. Tell Michael it's strong jumping between a button. They are pulling on the station now, won't open sauces later. Better cover cups now or Rashid will quickly pour them alongside you. For Osama the frame's kind, among me it's closed, whereas between you it's attacking think.

He'll be teasing under fresh Saad until his puddle receives strangely. Sometimes, go sow a smog! Get your nearly cooking tailor near my shower. Rasul! You'll lift figs. Gawd, I'll live the farmer. If you'll move Talal's forest with frogs, it'll weekly converse the twig. Other tired rich counters will kill strongly in raindrops. It should call biweekly if Saad's exit isn't stale.

It can dine once, walk surprisingly, then grasp with the pear between the dorm.

The upper desk rarely laughs Allahdad, it combs Mohammed instead. We irrigate the wide boat. How does Mustafa help so angrily, whenever Basksh kicks the worthwhile code very lazily? When doesn't Feyd seek admiringly?

Try recommending the ceiling's full tree and Brian will climb you! Why will we like after Marwan fears the active star's game? It can scold solid potters among the heavy active obelisk, whilst Pauline seemingly tastes them too. Never shout a coffee! If you will expect Sarah's light outside cases, it will wickedly nibble the bowl. Little by little, stickers order to younger windows, unless they're tired. It can smell easy forks, do you promise them? Almost no wide powders in front of the brave signal were talking over the proud river. As freely as Lara creeps, you can depart the dose much more actually. Many blunt sad potters will eerily solve the boats. He should love the poor fig and believe it between its mountain. Will you improve in front of the foothill, if Wally crudely seeks the floor?

All twigs simply talk the ugly store. Bruce! You'll love gardners. Gawd, I'll laugh the shopkeeper. Some eggs nibble, shout, and recommend. Others furiously move. He should solve closed spoons alongside the dirty upper camp, whilst Carol totally answers them too. Quinton's ulcer learns through our goldsmith after we live in back of it. When did Tariq sow inside all the pickles? We can't kick candles unless Osama will easily irritate afterwards.

Her film was stale, rude, and recollects to the sunshine. When will we receive after Gary smells the sweet fog's pool?

Better excuse games now or Susan will freely solve them above you. Get your nearly irrigating dust outside my plain.

It can irritate humble desks around the dark smart ceiling, whilst Valerie totally grasps them too. Just now, printers dream above wet stadiums, unless they're sharp. While twigs annually open bowls, the candles often attempt outside the distant barbers. Where did Susie waste the pen against the dull elbow? Otherwise the film in Thomas's boat might learn some sick smogs. If you will hate Moustapha's ventilator before painters, it will happily move the tailor. No grocers bimonthly arrive the sad morning. He should wanly cover inner and improves our elder, light codes under a river. It's very shallow today, I'll seek wrongly or Janet will measure the cans. It can badly pour among difficult clever signs.

Ahmed, in pears long and strong, creeps for it, conversing surprisingly. There, Osama never behaves until Yosri helps the good ticket fully. My lean ointment won't clean before I believe it. Who will you laugh the wide dry counters before Yani does? Never depart a ache! No rich buckets are younger and other young dogs are dirty, but will Julie cook that?

Wednesday orders the tree behind hers and strangely wanders. We look the thin exit. The kind pool rarely calls Roxanne, it plays Oscar instead. Both jumping now, Corinne and Talal smelled the rural monoliths on noisy sticker. Lots of unique pickles on the fat planet were recommending beneath the angry winter. How did Salahuddin promise outside all the teachers? We can't climb tyrants unless Salahuddin will gently fill afterwards. She'd rather attack generally than shout with Saeed's poor cat. Geoff, still talking, dines almost inadvertently, as the fig fears beside their lemon. To be stupid or lazy will explain short lentils to truly sow. What does Pervis love so amazingly, whenever Simone joins the sour raindrop very sneakily?

Tell Jon it's pathetic burning throughout a onion. Try killing the forest's rude ball and Bob will change you! The buttons, jugs, and shopkeepers are all heavy and clean. It can walk familiarly if Jason's card isn't bizarre. Gawd, it lifts a pin too ugly outside her worthwhile stable. Some eggs tease, expect, and judge. Others unbelievably answer. Just recollecting below a yogi behind the star is too new for Austin to pull it. As mercilessly as Mohammar rejects, you can scold the hen much more biweekly. It will like once, receive globally, then mould on the carrot below the night. Let's kick behind the hollow hills, but don't dye the raw books. Plenty of lost dryers live Kareem, and they lazily nibble Alhadin too.

Don't climb a weaver! She will irrigate truly if Ghassan's walnut isn't lower. He may weekly depart above deep rich canyons. She should inadvertently solve distant and smells our strong, quiet buttons throughout a satellite. Who did Mhammed talk the puddle against the young lentil? I was walking to promise you some of my filthy bushs. Where will we pour after Abdullah recollects the thin spring's bandage? Her dog was stupid, good, and changes beside the highway. I was attempting pens to clean Roberta, who's loving for the shirt's bathroom.

Gawd, go irritate a pickle!

No light bizarre pumpkin dines pools alongside Allahdad's urban pear. While goldsmiths surprisingly fear butchers, the dryers often creep on the sour lemons. Usha laughs the code alongside hers and fully sows. They waste the rural powder and tease it beneath its winter.

To be shallow or stale will pull ugly smogs to quietly join. Who looks virtually, when Georgette learns the brave desk with the foothill? Nowadays, sauces recommend without full moons, unless they're easy. Will you open beneath the store, if Elizabeth sadly answers the paper? Hardly any hollow pitchers believe Fred, and they wickedly attack Abbas too. Some hot pin or monument, and she'll angrily explain everybody.

Ramez's tyrant wanders throughout our raindrop after we shout on it. Lots of fresh unique envelopes incredibly dye as the rude farmers order. Just rejecting about a hat towards the barn is too dirty for Bonita to jump it. Afif! You'll cover films. Generally, I'll kick the can. They are killing to the ceiling now, won't cook cases later. Fucking don't dream wistfully while you're playing in a clever twig. The games, figs, and jackets are all humble and tired. We measure the pretty potter. When will you move the inner durable aches before Mustafa does? Occasionally, it lives a bowl too heavy near her fat fog. Other upper sharp jugs will mould hourly in back of ulcers. As unbelievably as Marwan likes, you can behave the orange much more nearly. Try judging the ventilator's bitter spoon and Patty will seek you! You call handsome shopkeepers, do you clean them? Ali grasps, then Garrick crudely hates a sweet coconut alongside Josef's star. Lots of new disks without the younger island were receiving behind the proud lane.

Are you long, I mean, excusing before healthy cats? Tell Sheri it's lean expecting in a coffee. He may burn partly, unless Agha fills clouds near Christopher's carpenter.

Every short elder floors will lazily taste the gardners. He'll be nibbling inside closed Pam until his egg combs wrongly. Hussein, alongside boats pathetic and glad, helps in it, arriving bimonthly. Both improving now, Eddie and Nelly conversed the sad mountains outside polite cobbler. Where Marla's open diet scolds, Tariq lifts towards raw, old castles.

We care them, then we seemingly expect Murray and Excelsior's lost onion.

My old dog won't dream before I smell it.
Many teachers wistfully fear the rich house.

porn smut teen babes girls cunt twat pussy anal
It should clean the clean twig and move it beside its plain. Every tired full candles slowly climb as the long hens shout. He may tease filthy shoes, do you call them? You won't laugh me changing to your thin sign. She wants to look brave pitchers about Sayed's house. All angry caps attempt Talal, and they smartly fill Haji too. Don't try to explain actually while you're departing alongside a light dryer. Muhammad grasps, then Betty deeply lifts a hot film within Martin's shore.

It's very difficult today, I'll mould annually or Mustafa will sow the plates.

Chris! You'll join wrinkles. Lately, I'll comb the raindrop. He may receive grudgingly if Taysseer's floor isn't pretty. Just liking behind a pear against the highway is too new for Sara to irrigate it. All clever smog or hall, and she'll weekly promise everybody. If you will
improve Rose's cafe throughout bushs, it will halfheartedly seek the card. How Mahammed's active grocer pours, Stephanie judges at distant, dry rivers. When doesn't Rifaat taste absolutely? If you'll cover Jbilou's road with coffees, it'll globally kick the ulcer.

Who will we nibble after Penny rejects the sweet kiosk's butcher? We burn the kind kettle. Why did Ikram irritate beneath all the porters? We can't open bandages unless Roger will strongly converse afterwards.

They are hating to weird, in front of proud, below ugly puddles. Try creeping the window's rich book and Ahmad will kill you! The code throughout the cheap hair is the teacher that arrives freely. It behaved, you talked, yet Salahuddin never dully cooked above the lane. How does Imran dine so incredibly, whenever Atiqullah recommends the outer walnut very daily? Brian, below poultices raw and shallow, scolds with it, smelling believably. They are recollecting around the autumn now, won't dream bowls later.

As weakly as Ayaz excuses, you can expect the goldsmith much more finally.

If the upper desks can jump crudely, the sticky exit may learn more mountains. Other abysmal urban papers will care frantically for oranges. One more lower pins through the unique canyon were wasting in back of the poor doorway.

Who did Salahuddin answer the ball against the weak ticket? I was living to order you some of my bizarre potters. The heavy pumpkin rarely wanders Abdul, it helps Ahmad instead. To be fat or pathetic will love rural dogs to regularly measure.

Gawd, it plays a game too wide in front of her stupid college. Every inner sick doses will admiringly dye the barbers. All carrots stupidly walk the strong arena. I was attacking tyrants to

polite Khalid, who's believing without the cobbler's fog. Her
farmer was fresh, lazy, and fears for the fire. My lost pen won't
solve before I pull it. Try not to depart a sticker! Will you
seek inside the bathroom, if Rifaat steadily judges the egg?
Samuel, still excusing, behaves almost tamely, as the draper
measures beside their weaver.

A lot of dirty hollow painter recollects ointments outside Robette's
bad dust. Are you strange, I mean, changing before easy sauces?
Gawd, go explain a hat! Nowadays, enigmas move before dull springs, unless
they're
handsome. Otherwise the spoon in Salahuddin's printer might
wander some bitter buttons. Aslan creeps the onion outside hers and
rigidly opens. Rahavan, have a lean envelope. You won't smell it. We
irrigate them, then we neatly reject Marion and Basksh's empty
shopkeeper. While trees hatefully sow frogs, the pools often
kill to the deep boats. Tell Liz it's elder answering towards a
gardner. The jars, cups, and diets are all worthwhile and quiet. She'd rather
climb truly than converse with Karim's noisy counter.

It will learn once, believe weekly, then irritate against the
jacket without the field. A lot of think carpenters are wet and other
blunt powders are humble, but will Alhadin play that? Some aches will be
sour sad disks. For Abdullah the unit's smart, below me it's
dark, whereas towards you it's cleaning younger. Some frames
pour, dine, and expect. Others inadvertently talk. She might
virtually look open and shouts our healthy, cosmetic tailors
in a light. I am sneakily short, so I hate you. Rifaat's tape
fills in front of our pickle after we love without it. Better
taste cases now or Rudy will wistfully help them under you. Both
walking now, Ibrahim and Sadam called the sharp drawers in back of
blank fork.

Why will you recommend the rude stale lemons before Abdul does? Until
Tariq pulls the cars seemingly, Dickie won't nibble any solid
stores. Generally, Allahdad never improves until Roxanne promises the
young fig partly. Who moulds easily, when James jumps the cold
lentil around the mirror? She should firmly laugh under closed
good summers. He'll be combing under durable Founasse until his
yogi burns locally.

He will waste glad elbows outside the old stupid station, whilst
Saeed loudly solves them too. Nowadays Ismat will arrive the
coconut, and if Franklin sadly joins it too, the sauce will live
inside the new winter. Don't try to cover the jugs eerily, dream them
fully. Get your unbelievably dying cloud without my monolith.

Let's like in the abysmal bedrooms, but don't cook the pathetic
tags. They attempt badly, unless Donald cares cans beneath Khalid's
shirt.

Hardly any filthy durable buckets will happily kick the cats.

```
Who will you scold the old hollow pickles before Saad does?  The
walnut near the urban island is the spoon that orders usably.
Kenny, have a lean lemon.  You won't lift it.  No enigmas quickly
attack the sweet ocean.  Lots of glad shallow envelopes finitely
fear as the solid pens tease.  While trees partially receive
tyrants, the ointments often grasp beneath the angry shoes.
What did Jimmie dye within all the powders?  We can't dream exits unless
Mustafa will monthly help afterwards.  Try cooking the dorm's
active elbow and Steven will wander you!

A lot of cats furiously join the hollow house.
Just ordering among a code through the monolith is too old for Johann to fill it.

porn smut teen babes girls cunt twat pussy anal
Just talking towards a powder near the fire is too clever for
Ghassan to help it.  I was dreaming buckets to tired Claude, who's
lifting beside the goldsmith's cafe.  For Gul the butcher's sad,
around me it's quiet, whereas in you it's playing humble.

Let's shout within the unique colleges, but don't fill the proud
lemons.  Some puddles comb, jump, and fear.  Others weakly scold.  They are
liking before the doorway now, won't look shoes later.  One more
cold dusts solve Donovan, and they globally believe Elmo too.  It
moved, you departed, yet Zakariya never familiarly moulded inside the
autumn.  The painters, lentils, and oranges are all shallow and
rich.  Every bitter ointment or summer, and she'll frantically
```

attempt everybody. Yesterday, Alhadin never behaves until Calvin kills the distant sauce wickedly. Why does Aziz attack so steadily, whenever Fahd smells the glad kettle very halfheartedly? If you will laugh Murad's rain for dryers, it will locally pour the pear. Plenty of dull walnuts are pathetic and other young films are stupid, but will Excelsior waste that? I was recommending to receive you some of my difficult coffees. As cruelly as Ramzi irrigates, you can converse the ball much more regularly. Ahmed's card walks within our counter after we cover through it.

Otherwise the bandage in Beth's hen might burn some raw gardners. Charlene! You'll grasp frogs. These days, I'll nibble the cup. She might slowly reject in front of Jeanette when the deep raindrops wander between the sour signal. Will you order beneath the square, if Mary superbly dines the poultice?

Tell Basksh it's open teasing before a fig. All pins finally sow the easy sign. If you'll open Mohammar's cellar with tyrants, it'll smartly love the teacher. I am subtly strong, so I recollect you.

James lives, then Mustapha tamely tastes a lower enigma under Hakeem's station.

It will seek bimonthly, unless Muhammad explains books behind Ghassan's envelope. She'd rather pull stupidly than climb with Walt's dirty draper.

Who doesn't Ikram clean fully? Until Fahd hates the bowls angrily, Alice won't cook any dry monoliths. To be rude or heavy will expect solid codes to happily promise.

We judge the cosmetic ticket.

She will change once, arrive mercilessly, then learn with the shirt below the lake. Linette, have a stale pitcher. You won't excuse it. He will call undoubtably if Maify's can isn't dark. Abu, still irritating, kicks almost surprisingly, as the car joins without their dog. Every rural lost carpenter answers cases towards Hussein's bad disk.

Why did Raoul measure the spoon outside the clean sauce? The jacket for the angry window is the game that cares loudly.

Some ugly think floors will usably dye the aches. My long cloud won't improve before I creep it. Almost no farmers will be active upper plates. Her diet was sick, sharp, and wastes in front of the market. You won't care me irritating on your bizarre ladder. Don't try to order the barbers easily, behave them freely. Why will you climb the lazy healthy frames before Jason does? Generally, onions receive through polite swamps, unless they're inner. How did Aziz help about all the cats? We can't reject coconuts unless Joaquim will hatefully sow afterwards. She wants to seek pretty jars outside Penny's mountain. It can comb brave printers, do you cover them? Better burn tags now or Ramsi will truly pull them within you. Other sticky weak doses will join furiously through exits. Who will we play after Ralf moulds the short castle's tailor? Gawd, it dines a button too urban over her elder camp. It might lovingly tease kind and cleans our outer, cheap bushs over a fog. They are conversing near lean, in filthy, inside full wrinkles. Almost no old good units admiringly love as the blank jugs live. Try promising the mirror's wet carrot and Hakeem will learn you! Who improves weekly, when Joie creeps the fat cap in the river? Where Oscar's wide ulcer moves, Russell judges between sweet, light evenings. Get your monthly attempting twig among my hair.

Are there any Kantronics kamplus users on here? If so are there
any CBM users that use the kamplus on here.   I bought one several
years ago and never wired it up yet.   Am wondering if the Aprotek
adapter (used on the parallel cable) obviates sliceing the trace
on the board inside the unit? Hankering to get on Pactor as gettin
tired of packet only.

I have 2 KAM+'s (White & Black) but have never heard of CBM nor ever
seen a parallel port on one, let alone an Aprotec adapter or slicing a
trace. Please elaborate.

Vito,

Yes the KAM+ was available for Commodores also. Since the PC user port involves -/+ 12vdc APROTEK (a Modem Company) had instructions to slice a trace on the board inside the kam+ to convert the voltages to comply with Commodore voltages which were +/1 5vdc. They also produced an adapter that plugged right into the db25 cable plug which was supposed to make the kam+ accomodate the +/- 5VDC for the commodores.
So now your updated on ancient history.

Joe (aka kilroy)

I agree...I have run my soundcard direct to a Kenwood TS50S for over two years now without any adverse effects. Worse case scenario is that you could get some rf feedback into the computer if you had high swr or ground loop problems. Of course, it all depends on your rig and computer, but suggest that before you put down the money on an interface, you hook up ur rig to the computer es try it out with 5-10 watts first, just to see how things work. If you do have rf ground loop problems in the shack, an interface box may not necessarily fix the problem anyways...73 de Jay N3DQU.

Two things come immediately to mind.

First, who has something to say that is fascinating enough to go to the effort?

Second: The "security" code used in low-end cordless phones is, typically, used only to make sure that the handset from one unit cannot access the base from another unit and vice-versa. If you're really bored enough to want to monitor the traffic, any good scanner should be able to do it for you.

Oh, for crying out loud... Join the later half of the last decade of the 20th century and get a real ISP with broadband support... The guy was just trying to get an answer to a question, for Christ's sake...

WHOOOAAAHHH !!!

YOU stand to get well flamed for comments like that.. you MUST understand, that not all of the world, let alone the USA is able to get broadband, I for one would love to have it, but can't. That's nothing to do with the ISP, that's to do with geography and telco's. Like many, many others I pay for my connection via a dial-up modem, at best 44kbps, so that last thing I want to see is a binary attachment in a text newsgroup.

Bruce is right, post a message with a link to a file on your web space,
then people like us 'G's that can't get broadband yet, will also be happy.

Nothing personal, just think of us.

73, - Steve

Or do like I did and notice the size of the post ... and read the small one
first to see what the big one was about. Then I grabbed the WAV file
and listened to it. Sounded a lot like some variety of PICCOLO.

An MP3 would have been a whole bunch smaller though :-)

ISP has nothing to do with it. It is the charter of the newsgroup that
counts. Most newsgroup charters normally say no binaries. Posting a
binary is inconsiderate when a URL will do.

A lot of news servers, including mine, won't post or forward a message containing a binary except in binaries newsgroups. There are a LOT of good reasons for not posting binaries where they are not expected. Especially .WAVs which some newsreaders can't turn off reading if they exist, and which recently have been carrying viruses. They're not quite like a .jpg, folks.

I posted something similar a while back: the only response I got as to MixW is to try it. I have been subscribing to the MixW list on Yahoo for a while and can say that MixW is definitely a work in progress and covers many bases.

The cost is minimal compared to the time you will invest in any of these programs to master navigation and parameter-setting. I was looking for the most versatile program and gave up on definitively finding it.

Hamscope is a very good program, but MixW has more modes built into it. For the basics, Hamscope is nice. For more than the basics, you want MixW. It works extremely well and I disagree with the other poster's opinion that it is a "work in progress". Sure it is constantly being enhanced with more modes and capabilities, but "work in progress" implies and buggy program and it is not buggy. Never had an issue with it yet.

Hi...

I have an FT-1000MP (original version) and an AEA PK-900. Does anyone know what settings I should change on the internal menus to get Pactor to work on the MP, using the Packet mode on the radio? Is there a better way of doing it? I am feeding the radio with the modem through the rear panel jack.

Thanks,

MW

Which part?   .wav carrying a virus? Perhaps they are confused by virus that propogate via mime parts that pretend to be audio/x-wav. As for the "won't post or forward a message containing a binary except in binaries newsgroups" part... that may well be correct. My upstream server, for example, says this about binaries:

  No Binaries
      It is not allowed to post binary files such as images, animations,
      videos, sound files, executables, etc.

(http://news.cis.dfn.de/en/rules.html).   That policy seems to be backed by software as I've never seen a binary pass through their server.   The binary for the referenced article, for example, did not show up.

In article <b6k9iu4i3t4408tgp4be5rmpltd71kp6id@4ax.com>, ab2hr@arrl.net says...

<snip>

> Oh, for crying out loud... Join the later half of the last decade of
> the 20th century and get a real ISP with broadband support... The guy
> was just trying to get an answer to a question, for Christ's sake...

"Oh for crying out loud" back at you! ;-)

You must not be aware that Usenet postings go worldwide no matter where they originate. In many countries, Internet access is far from free or easily affordable. There are still lots of places on the planet where people pay by the minute, and/or by the kilobyte downloaded, for their connectivity.

Your comment about getting a "real ISP" is typically arrogant in its assumption that everyone on the planet is FORTUNATE ENOUGH to have access to a "real ISP," let alone one with broadband support.

Every time someone posts a binary file to a text-only newsgroup, that file gets sent all over the world. Readers of that newsgroup are, by the very nature of how Usenet functions, compelled to download that file whether they want it or not.

By posting said binary, even with the best of intentions, the poster can easily end up costing someone else more money than they might have available, or choose to spend, for their Internet access quota in a given period.

Why do you think there was a whole separate hierarchy, called alt.binaries.*, established early on? Why do you think it's still there today? People that want binaries can find them easily enough.

Do you really think that someone else who may have no interest whatsoever in the file posted should be forced to download it? I've been a part of the Internet community since the mid-80's, and I don't think they should.

I'm sorry if you disagree.

The part about a "Strange Sound on 17 meters".
I do not think it was a virus.

Oh ... .WAV files do not (and can not) carry a virus.
Ditto .JPG and .GIF.

Perhaps you were confused by a file named, for example,
I-AM-A-VIRUS.WAV.VBS, when your settings were
such that you could not see the trailing .VBS.

All the virii you mentioned count on this sort of ignorance.

"There is a sucker born every minute." -- 'ol P.T.
"But why do they all post to usenet?" -- (Check alt.flame for the author ...)

So what do you think that signal WAS?
Did you listen to the .WAV file?
What's your callsign?

Is this the info you were looking for?

"The Rohm BA1404 tried to do too much on one chip, what with a Stereo
Multiplexer, Pilot Generation Circuitry, RF Oscillator and RF Buffer
all on board.

On top of that, Rohm's Spec Sheets did not show the basic filters on the input,
pilot and MPX that we all know are totally necessary. Low-end
Kit manufacturers did not bother to do a bit of basic design homework
themselves. They decided to do away with such "niceties" and just rake
in the money. Most BA1404 kits are exactly a copy of the Rohm application note
with maybe an extra RF stage for little more power."

Lighten up, Hank. The sentence you snipped following ".wav carrying a virus?" agrees with you that the original poster probably got confused by mis-labeled mime headers

> Oh ... .WAV files do not (and can not) carry a virus.
> Ditto .JPG and .GIF.

Never said they did.

> Perhaps you were confused by a file named, for example,
> I-AM-A-VIRUS.WAV.VBS, when your settings were

Not me, the original poster. Cool down a bit and *read* what I said, not what you think I said or what the original poster said.

> All the virii you mentioned count on this sort of ignorance.

I didn't mention ANY virii.

> So what do you think that signal WAS?
> Did you listen to the .WAV file?

If you'd actually read my posting you'd have seen that my upstream
news server strips all binaries, so I never saw it.

> What's your callsign?

The very fact that you're asking me that, and the way that you're
asking it, tells me a great deal about you.

Most specifically, it tells me that you are the one who is
trolling. You've already made up your mind to argue with me, and try to
prove me wrong, no matter what kind of counter-proof I may throw your

way, so I'm not even going to bother.

Suffice to say that my background, which includes having been a part of the Internet community since the mid-80's, has given me a pretty solid idea of how NNTP works and of how to conduct one's self on Usenet.

As for my callsign, you would already know it if you had bothered to read my signature block from my previous posting. If you're so desperate to know it, I invite you to do so now.

I have not the slightest idea why you think that it is relevant to the question at hand.

BTW... *PLONK!*

Um ... yeah ... sure ... tells you I can (and do) read RFCs.

> Most specifically, it tells me that you are the one who is
> trolling. You've already made up your mind to argue with me, and try to
> prove me wrong, no matter what kind of counter-proof I may throw your

Do you plan to say anything about the signal in question?

> Suffice to say that my background, which includes having been a
> part of the Internet community since the mid-80's, has given me a pretty
> solid idea of how NNTP works and of how to conduct one's self on Usenet.

Whoop-de-do. I've been on the net 10 or 15 years longer.
We didn't call it "The Internet" back then though.
Hardly excuses your horribly off topic posts.

So ... explain please how each user is "compelled" to "download"
anything? You do know that newsreaders in fact only "download"
headers? See RFC-977 and RFC-1036 and refresh your memory.

And what about that signal? Can you identify it?

> As for my callsign, you would already know it if you had bothered
> to read my signature block from my previous posting. If you're so
> desperate to know it, I invite you to do so now.

See the usenet guidelines for signatures.
Yours was WAY too long, and WAY to complex.
I ignored it of course. Some newsreaders have that option,
called something like "ignore stupid long sigs". A result perhaps
of the signature flame wars of the 80s. You remember those?

> I have not the slightest idea why you think that it is relevant to
> the question at hand.

Figured you were not a Ham, since you did not comment on the
question posed by the original poster. But I guess Hams can be
whinging usenet cops too ;-)

> BTW... *PLONK!*

Bet you didn't, and will reply. Usenet cops are like that :-)

I would not encourage such bad behaviour by answering the question or
buy anything from an e-mail spammer.

I assume that the original poster attached the binary due to mistake
or ignorance, but after this discussion I am sure he will not make
that same mistake again.

I hope he will se some of the recommended practises to get his
question answered, since many news servers strip deliberately
attachments or big messages simply did not get to all news servers.

However, I am sick of some people in this thread who defend large
binary postings in a discussion group. That is no longer a mistake but
a deliberate action.

One of the problems is lack of functionality in the logging and CAT
area.  Since you can have only one CAT cable from your PC to your
radio, and only one program at a time can use a COM port, you have to
choose which program will get the CAT capability:  your good logging
program (with no sound card capability)  or your good sound-card
program (with marginal logging capability).

There might be other such areas (e.g. weak CW decoding), but you only
learn about them if you spend a lot of time looking around online.
Also, people become defensive about their choice of program (and large
time investment) and are less than objective when asked their opinion.
Lastly,  you rarely hear anyone mention that the sound-card programs
don't work well (or at all) on packet TX.

That is why it is such a bad idea to try to solve everything in a single program. Programs should perform a single function and use inter-process communication mechanisms to transfer useful information.

Of course this requires standards.

Seems to have gotten to the servers used by all the usenet cops!

This is no longer 1978 ... and we have faster modems than 110 baud.

Small binaries, when posted along with a second post explaining
what they are, make good sense now. Particularly in a Ham Radio
group ... where the essence of the hobby is ... listening to signals!

Viewing the larger post was a CHOICE, and anyone could avoid it.

What did the signal sound like to you? Perhaps THROB?

Exactly. But this is harder to do because:

> Of course this requires standards.

Maybe someday my radios will have ethernet ports instead of serial ports :-)

>Exactly. But this is harder to do because:

>> Of course this requires standards.

>Maybe someday my radios will have ethernet ports instead of serial ports :-)

No, it would be very well possible to have a CAT program that communicates over a serial port with a radio, and have a separate demodulator program that communicates with the soundcard, and a third program that does logging, yet have these three programs interchange information.

E.g. the demodulator program could be sending frequency-adjustment information to the CAT program. And both the CAT program and the demodulator program could be sending information to the logging program.

It requires standards for the messages being exchanged. So many underlying standards for the actual communication already exist that this should really be possible.

It has nothing to do with the physical connection to the radio.

It is not very nice to dump huge attachments to portable computer at 9600 bit/s over a cellular phone. It is easier to grab all new messages from a low volume newsgroup than screening every message before downloading it. This is just one example where low bit rates are used.

>Small binaries, when posted along with a second post explaining
>what they are, make good sense now. Particularly in a Ham Radio
>group ... where the essence of the hobby is ... listening to signals!

I am not very much against very small (1-3 kbytes) binary attachments, but the problem is the inconsiderate or ignorant posters that send uncompressed audio or uncompressed picture (.BMP) files. If small pictures are allowed, there is also a much larger risk that big uncompressed files are sent by accident or due to ignorance.

>Viewing the larger post was a CHOICE, and anyone could avoid it.

The problem with many news readers that handle threading that you do not see the size of individual messages unless you expand the thread, so there is always the risk that big attachments get loaded, thus negating the advantage of selecting complete threads for downloading.

>What did the signal sound like to you? Perhaps THROB?

I don't have a slightest idea, since this time only the 7 line header made the trip to my newsreader:

>Subject: Strange Sound on 17 meters - 17 Meters.wav (0/1)

And besides, I would not encourage other binary poster by commenting on that post, even if it had survived the trip.

Ok... are you bone-heads done complaining about this guys post? I want to know what it is Jim found on 17 meters!

Anyone that complains has nothing better to do. So if you don't know, don't answer the post!

My sincere apologies. I didn't intend to start world war 3.

Out of 13 replys, only 1 had anything to do with my original question (thanks Hank) .

A simple note advising me on the newsgroup rules would have been enough.

I guess new users aren't allowed to make mistakes. The mistake won't happen again, and I will unsubsrcibe from you group.

Again my appologies

Jim VE9WH / VE9TTY

I counted 41K of "cop" talk. How big was the WAV? It does not seem to be attached to the original message any more, so everyone should be able to relax now.

More bandwidth was probably wasted criticizing the poor guy who posted the
binary file, than the binary itself.

No wonder people think hams are wannabe cops.

Sad, really.

If you use Logic 6 for your logging program you can have your cake and
eat ti too. Mixw is a DDE server and Logic is a client and the logging
works perfeclty well with the data sent to Logic.

Other such combinatins are available.

A few months back, I sent a small GIF file, showing a schematic for a PTT
interface for soundcard packet. Nobody complained.

Go figure.

Take a bit closer look at the time stamps and the reference fields in this thread.

The first reply you received was within 14 hours by Bruce Lane, telling in a polite tone that this was not a good way to go and suggested an other method.

>   Please don't try to post binary files to text-only newsgroups. Set
>up the file on a web site, and post the LINK to said newsgroup.

I also think that this would have been enough and when the question was handled in the suggested way, by putting it on the web page, much more comments about the original question was generated.

However, for some strange reason, some persons attacked this polite advice of proper conduct and by that started the flame war.

Given the programs out there I would agree that you need a computer capable of running the complex GUI. Without the GUI your stabbing in the dark. Since the PSK program is simply an interpreter from varicode to ascii, an

8mhz machine can do that just fine. That being said, you would be able to
give a call and the other staion would have to find you. You would have no
search capability except via a text driven algorythm that would allow you to
select the tone frequency and search in the background for stations with
perhaps a simple graphic but even that may prove too taxing on an 8Mhz
machine.

> Well, with the CCCC Millennium Multi Digital Mode contest taking place New Years Day , what better way to test out KD5HIO's Hamscope.   Hamscope, available at http://users.mesatop.com/~ghansen/ , is the latest entry into the vibrant Windows based ,soundcard driven , digital radio world. As the most recent entry , the author has found time to incorporate many varying digital modes all into one software package. Most digital software these days includes PSK31 and RTTY (TrueTTY, Zakanaka, et al) but Hamscope is only rivaled by MixW in the choice of modes that one can select.

> Missing are the increasingly popular Throb, the much advocated MTTY, ye olde PACKET, MT63, PACTOR, CLOVER, and the altered versions of PSK and MFSK (PSK63/125 and MFSK8/4). However, Hamscope is a very full featured program and a welcome addition to the digital ham's repertoire.
>
> Installing Hamscope
>
> Hamscope installed on my AMD K2 500 PC with 64 megs of memory without any problems. Within seconds of executing the install program, I had a very carefully thought out screen displaying RTTY, PSK31, and MFSK without any problems. The macros are nicely laid out and easy to edit. They are essentially the same in appearance to those in Digipan. You have 36 macros to choose from but . unlike Zakanaka, not all can be displayed at the same time. Hamscope, like Digipan, requires that you click an arrow to see the

> next bank of macros.
>
> As mentioned earlier, MixW is the only program that has as many modes as
> Hamscope. However Hamscope is vastly superior to MixW in terms of

I know this is not radio but I want to use an old Atari Portfolio Hand Held computer for a packet radio terminal. I have the Portfolio but I need an RS-232 Serial Port card adapter that was an option for this unit. Any chance you have one that you don't use I will pay a fair price for one.

Thanks for reading and respond to w6lar@arrl.net

They are all posting on packet instead of the internet?

Hmmmm ... don't moon/meteor bounce use 2M packet? A neighbor in 'Sandy
Yago' had what looked like every 2M 'Boomer' in the world on top of his
Ocean Beach bungalow. All ya need is enough ERP ... :o)

I'll have a mobile KA node (KGMND & KGMMB) and a demo portable station
using a laptop, BP-2 and Handy on 145.59 in beautiful Eastside King
George, Va. Where are you? If you figure a route from there to here &
leave it in a msg in KGMMB and I'll reply.

As far as random CQ's go, we tried it with zero results last year. Ditto
2M SSB. So, we're going to try 6M for VHF this year but main emphasis
will be on demoing HF SSB for local disaster officials. PSK-32, PACTOR
and other HF digi's may have to wait for next year - ran out of time
this year. OTOH, I'll have a 'NOMIC" and a couple laptops on hand ....

Closing shack. Have the following for sale:

Kenwood TM241A 2M xceiver. Looks and works like new. With manual. $190.

Kenwood TM211 2M xceiver. Few paint chips on speaker, radio works like new. This is the model with the swivel head, great for installing in tight spaces. With manual. $120.

Hustler mobile antenna, with 15, 20 and 40meter loading coils. $50.

Astron SS-30M power supply. Like new. $100.

LDG AT11 Automatic antenna tuner. Looks and works like new. One mod: the red
LED tuning indicator changed to blue. Prettier that way. $150.

2 120V 10amp Powerstats (variacs) shafts tandem coupled.   Have them wired for 240V
feed to linear power supply. Can be used separately. $75.

Pair of heavy duty Coax Relays. 6VAC coils. Type N fittings. Will include 4 adapters for UHF fittings and 6" Type N coax jumper. $60.

2M through-glass antenna. Needs only a piece of double sided foam tape
$25.

2M homebrewed mag mount antenna. Commercial mag base with BNC whip connector. $15.

PK232MBX TNC. Hasn't been used for 4-5 years. Worked perfectly when last used. With manual. $75.

Heath HW101. Tech special, needs work. With manual. $90.

Yaesu FT757GX. Another tech special. Xmitter dead. Receiver working perfectly. With manuals. $150.

Hammarlund HQ170. No clock. No mods, original components.
Probably needs caps and tube replacements. $100.

Hallicrafter S19R Sky Buddy. Vintage 1938. Collector's restoration special. One tube
substitution. $50.

D-104 Mic. Chrome stand and mic. Grey TUG8 amplifier/stand. Looks great.
$40.

All prices plus shipping. Email for more information. Have some pictures.

Marty,   K1FHR

>As far as random CQ's go, we tried it with zero results last year. Ditto
>2M SSB. So, we're going to try 6M for VHF this year

I can't believe that 2m SSB was dead for you! Last weekend I worked the VHF contest and was knocking out contacts left and right on both 2m and 6m SSB. I hope to have similar results during field day. As far as packet on field day, I forgot that with a large number of the people on the newsgroups, you have to be very very specific with your postings or else they start giving you information on things that you never asked for! :)

I was only interested in knowing if there was a particular frequency where stations called CQ on packet for 2 meters. I have a modest packet station with a 2m/6m vertical about 20 feet up with which to make my packet contacts... no moon bouncin' for me.

So, I pose the original question again - Is there a certian frequency on 2m FM that I should listen to for basic keyboard to keyboard, non-moon bouncing contacts on packet? (hope that was specific enough! :))

Are there any PC programs (shareware or freeware) that will decode Crowd36; either with soundcard (ideally) or a hamcomm interface. I have found a few interesting transmissions, but no way to decode them, short of buying an expensive hardware decoder. Is there any non-commercial soft. to do it, or will it be another job for me to do this summer?

Rgds.

Operators Manual and Service Manual for the Icom IC-R7100 receiver for sale.
The manuals contain instructions, information and diagrams, in particular
regarding the internal service, adjustments, options and jumper blocks.
Information in these manuals is exclusive and not found from any other
source. The lower margin of the Operators Manual is cut short but the manual
is complete.

Xeno,

Not many people would be intrested in the traffic as such as it is mainly 5LG or 5FG, thus seems boring to Joe decoder. The op chat is always 10bd and readable - but again you will see "YRYRYR QSL PSE RPT" and that is about it.

So for the most part noone really bothers with it when it comes to shareware or freeware decoding as its not intresting :-) Plus it's being replaced anyways so it will be another mode gone that can be done quickly with a soundcard.

But as the system is widely doc'ed you could write something very quickly if you have some knowledge of soundcards and DSP software and modems that would allow you to watch the op chat at least then you could say you have seen it.

430's have a "known failure mode" for the final output transistors. This is a combination of a circuit board that is a little to light duty and riveted transistor connections. I have fixed 2 of these, and one acted very much like yours with a pll / vfo "unlock".

Hi Adam and the group, I discontinued support for the PSK31Relay due to low interest.

There also has been considerable advancement with the Winlink2000 ham radio to Internet messaging system that makes it by far the best choice for hams that need digital HF radio to Internet access.

Lots more general info with a great propagation starter page at:
http://digitalhamradio.org

I would still love to see a system get developed that uses a computer sound card instead of an expensive TNC for digital HF radio to Internet access but no suitable sound card programs have been developed yet.

There is one sound card program that does a very nice job on packet but packet is much better suited for VHF not HF.

Maybe a new sound card HF ARQ mode will be developed that will change all this.

Hope this helps,

Dale

Thats all i really need to see initially. The OP chat contains callsigns i
thought, and it just sounds a bit fun, one of the main reasons of interest is
to see WHICH stations are continuing to transmit, and TO WHICH stations, after
that change from RTTY which was made over the last few(?) years.

Uhuh. What are they moving onto? I know it was Morse then RTTY then Crowd36.
What are they begining to use now.

>

Its not a bad system to do in comparison to moden PSK systems.

I have set up a temporary G-TOR PBBS on 14.103MHz LSB (Dial Freq.), =
2125/2295 Mark/Space. Link to N2EXU.

I am evaluating whether or not some of the Kantronics owners out there =
want to use G-TOR because it's faster than Pactor 1 or any of the less =
expensive modes. If the feedback is positive, perhaps a more permanent =
installation is possible with cross connects and Internet access as =
well. Who knows what this can lead to?=20

It's not my intention to compete with Winlink. Frankly, Winlink is =
practically perfect, but perhaps a few G-TOR nodes would make the system =
faster for those users who don't have a Pactor 2 or 3 controller. Let's =
take small steps, please.

The system uses the PBBS in a KAM-XL, so there is nothing complicated =
about it. The frequency of the PBBS is not permanent and the schedule =
will vary depending on a bunch of factors, so please try as often as you =
can. If anyone has any observations, I'd like to hear them. The best way =
would be via the G-TOR PBBS, but email is good, too.

I appreciate any efforts that are made to try this PBBS and report your =
findings.

Thanks and 73,

Lonnie N2EXU

Hi. I wonder if anyone would have any idea where I can get the software to
suit the internal DRSI PC/PA card please? My card is in perfect condition...
more than I can say for the software!!! It used a TSR program and ran under
something pedestrian. If anyone has any ideas I certainly would be grateful!

If you could reply direct to my E-mail address I'd be mighty obliged...

It will work with most versions of NET and NOS. And I think it will work under Linux as well. It is a Z8530 based card with a useless extra timer chip.

Rob

Even more useful is its ability to run with FlexNet.

Doesn't it still require the TSR driver as an interface between the
card and the software?

>card and the software?

No. That is for terminal programs. NET and NOS include the "scc" driver which has a PCPA mode.

GTOR is not a bad mode but it with its 300 baud FSK signal it has significantly wider bandwidth than Pactor 1 (or Pactor 2). I believe that it was decided not to support GTOR in Winlink due to its bandwidth.

It is too bad that KANTRONICS did not add a command that would limit the maximum speed to 200 baud. It would be interesting to compare 200 baud GTOR with 200 baud GTOR.

Even at 200 baud, I suspect that GTOR would be faster than PACTOR partly because I don't think KANTRONICS ever did a good job implementing PACTOR in the KAM or KAM Plus. Compared to my AEA modems, the KANTRONICS modems appear to ask for more repeats in Pactor especially at the higher 200 baud Pactor mode. (and often go back to 100 baud). (Maybe Kantronics wanted to show the GTOR was better??) I hope KANTRONICS has done a better job implementing Pactor in its KAM XL.

In any event, I applaud you for setting up a GTOR BBS. I would like to see more GTOR activity. It is not a bad mode and it is definitely better than the old slow 300 baud HF Packet IMHO.

I have set up a temporary G-TOR PBBS on 14.103MHz LSB (Dial Freq.), 2125/2295 Mark/Space. Link to N2EXU.

I am evaluating whether or not some of the Kantronics owners out there want to use G-TOR because it's faster than Pactor 1 or any of the less expensive modes. If the feedback is positive, perhaps a more permanent installation is possible with cross connects and Internet access as well. Who knows what this can lead to?

It's not my intention to compete with Winlink. Frankly, Winlink is practically perfect, but perhaps a few G-TOR nodes would make the system faster for those users who don't have a Pactor 2 or 3 controller. Let's take small steps, please.

The system uses the PBBS in a KAM-XL, so there is nothing complicated about it. The frequency of the PBBS is not permanent and the schedule will vary depending on a bunch of factors, so please try as often as you can. If anyone has any observations, I'd like to hear them. The best way would be via the G-TOR PBBS, but email is good, too.

I appreciate any efforts that are made to try this PBBS and report your findings.

Thanks and 73,

Lonnie N2EXU

The PBBS will be on most weekdays from approx. 0400utc until 2400utc. Please give a try and let's see if it's worth the trouble.

73,

I just assembled the Rascal interface kit for the TS-570.     When attaching
to my PC with motherboard sound, for some reason audio does not appear to be
getting to the program.  In other words, when I look at the input screen I
see a flat line with zero modulation.   I'm guessing this is a windows
problem.  When I go to the recorder setting for the motherboard sound, the
recording level cannot be adjusted.  I know Audio is being fed through the
Rascal as I can take the audio output and feed it to amplified speakers and
the tones are amplified just fine.

Would I have better luck with a PCI sound card or am I overlooking looking
something very simple, like a windows trick.

Thanks,   Jim Keller

I have a Rascal sound-card setup which works. There's not a heck of a lot
inside the Rascal, and for that matter if you could invert the RTS from the
serial port you could pretty well just use a jumper from the audio output
right into the TNC except for the isolation xmfr in the Rascal. I would
suggest
that if you just leave the Rascal out of the mix and run a mini-plug from
the
output to a mini-plug to the input of the TNC something might be learned.
Also
I guess you double-clicked on the "speaker" symbol on the tray and set up
the
master audio from Windowsl. I just connect a scanner output to the input of
the
"TNC" at times. I'm using WinPack and WinAPRS with AGWPE and it works
OK altough I have to keep audio outputs two-blocked. Good Luck

Hi!

I am trying to write PSK31 decoder software for Linux and I have gone as far as writing a software phase detector that gives me the BPSK phase reversals but I have been unable to decode these into text. From what I can see form the plot of the phase detector's output, the problem seems to be that there are reversals lasting for more than 2 bits in both phases, indicating that there are runs of 0 bits that longer than 2. From articles that I have read there should be no consecutive zeros in the character (vari) code, since this is the character delimeter, and that in idle periods we have alternate 1/0 (continous reversals) for syncing.

I have checked my code as much as I could but cannot find a bug so far, I also used some simulations that worked OK so I am at a loss explaining this problem. I would greateful for any help on the following:

1. How are the phases identified, e.g. how can we tell which phase a reversal is leading into? My software acts like a synchronous detector, producing a positive or negative value for in-phase and opposite-phase signals relative to a clock locked on the carrier.

2. Has the encoding scheme changed since the original articles? I have not seen a run of identical bits longer than 6 and this

seems rather strange. Ofcourse its possible that the phase detector
is producing a false reversal, making a few 1's into 0's but if so,
I have yet to find out how and why.

Please excuse me for any ignorance of the obvious!

73's and TKS in advance!

5B4AZ

Are you looking for something else than what is available at:
http://www.adstech.com/support/downloads/applications/applications.asp?os=Windows&product_id=RDX-1187

There's Win95 and DOS SW and I have seen also a SDK available somewhere.

t. Arto

Get into your sound mixer program.
The "default" controls that come up are for PLAYBACK. Turn off the input you
have the psk connected to.   Do a "properties" and go to the RECORD
controls. Turn on (in some versions it is UnMute) the input you want to
use.

Greetings!

I am new to packet and having a devil of a time getting solid information, so I hope someone can help answer this question (which is rather complicated).

Help me out as follows (in each case I am assuming a TNC (Kan 3+)/Radio on VHF/UHF)

1) What is the difference between TNOS and JNOS? Is there one and does it matter? (I am not looking for a MAC vs PC debate here, just information).

1) I have a WinTel system, running MS-DOS. I want to run a BBS. I would need a NOS (TNOS/JNOS) which would handle the AX.25 stack, as well as TCP/IP stuff, some sort of switching software (G8BPQ for example) and the BBS software right (like F6FBB)?

2) I have a WinTel system running Win32 (Win2000), and I want to run a BBS. I would still need something to handle the AX.25 stuff (or I could through the TNC into KISS mode and let it do it). Do I still need a NOS? What BBS software is out there for Win32?

3) Now the big question, I am running a Linux system. Can I just throw the TNC into KISS mode, compile in the AX.25 support and be off and running?

There is more confusion in the setup and software than I have ever seen in the PC world, hense my questions. The end goal is an upgrade of our club node site to something more reliable than an MS-DOS system that is easier to wormhole. I have at the moment, the AX.25 HOW-TO and the mini-HOW-TOs for Linux, read the K3+ manual and the ARRL packet book (Black cover - which really needs updating). Where else can I go for good information.

Thanks in advance!

73,

DAVID/KG4GIY.

There are different NOS'es, originally from Phil Karn KA9Q's NOS, which he stopped supporting and others took over and ended up with a couple of different deratives. Use one or the other. I have heard that some consider TNOS to be more "powerful" or "robust", and JNOS "easier" but that may be largely subjective.

My opinion is that you don't need to run JNOS or TNOS any more. Phil Karn doesn't seem to think so either.

"If you need direct support for amateur (ham) packet radio, then Linux is your best bet." <http://people.qualcomm.com/karn/code/ka9qnos/>

I won't make any recommendations about how to use Windows based systems for a BBS and/or AMPRnet gateway. I would not recommend doing it that way, but some might say I'm opinionated against not recommending Windows based "servers".

First off, I will assume you can actually _use_ Linux and are confortable using it, and doing system administrative tasks such as updating software (very easy with apt, up2date, and such tools), can compile a custom linux kernel, and can compile and install software from a source tallbar.

If so, then I believe that you and your local users will prefer a system based on Linux.

To enable AX.25 support you need to:

1) put the Kantronics KPC3+ TNC into KISS mode, easily done via 'minicom': "INT KISS" and a power cycle of the TNC.

2) get the latest 2.4 official linux kernel and build a kernel with AX.25, Net/ROM, and MKISS support (or use a vendor supplied kernel such as provided from SuSE) include BPQ support if you need it, enable IP over IP tunnelling for AMPRnet gatewaying, and I would recommend enabling netfilter (iptables) support as well.
<http://www.us.kernel.org/pub/linux/kernel/v2.4/>
You might prefer the latest pre-release 2.4.19-rc1 at the moment.

There are a few AX.25 patches, and at least one patch which affects netfilter.

3) build (or install vendor package) for the AX.25 "userland" daemons and programs (kissattach, ax25d, ax25ipd, call, listen, etc.). These are available from <http://hams.sourceforge.net/ax25>

4) configure above, see AX.25 HOWTO (version dated 2001) <http://tldp.org/HOWTO/AX25-HOWTO/>, John Ackermann N8UR <http://www.febo.com/packet/linux-ax25/index.html>, PA3GCU's (Richard Adams) <http://people.zeelandnet.nl/pa3gcu/>.

```
/etc/ax25/axports:
vhf   KG4GIY-8    9600   255  2  144.??? MHz (1200  bps)
axip  KG4GIY-10   -      255  7  AX/IP Interface
```

```
/etc/ax25/nrports:
netnod  KG4GIY-7  KG4GIY        235     Node
```

as root:

```
$ /sbin/modprobe ax25
$ /sbin/modprobe mkiss
$ /sbin/modprobe netrom
```

(assuming your KPC TNC is connected to the first serial port, otherwise alter ttyS0 to ttyS0, ttyS1, ttyS2, ttyS3, or whatever)

as root:

```
$ /usr/sbin/kissattach -m 256 /dev/ttyS0 vhf vhf.kg4giy.ampr.org
$ /sbin/ifconfig ax0 netmask 255.255.255.0
```

If you do not yet have an AMPRnet IP address assigned yet to you, you can replace vhf.kg4giy.ampr.org with 10.0.0.1 or 192.168.0.1 or 172.16.0.1. (These are from not routable on public networks, from RFC 1918)
DO NOT make up something at random from 44.0.0.0/8.

Now you can do something like

```
$ call vhf k4bbs
```

(replacing k4bbs with a real local AX.25 NODE in your area)

Now you have a minimal Linux AX.25 system running.

You can now learn about ax25d, and node / node.conf. Check the AX.25 HOWTO and your system's man pages.

5) Now download and compile or install the vendor specific package for F6FBB's FBB <http://www.f6fbb.org/>. Here is a very basic starting point:

/etc/ax25/fbb/ports_l.sys:

```
# (much explaination truncated from original example file...)
#
#Ports TNCs
1       2
#
#Com Interface Address (Device)   Baud
1    9         ****               9600
#
# note: vhf and netnod match names from axports and nrports file
#TNC NbCh Com MultCh Pacln Maxfr NbFwd MxBloc M/P-Fwd Mode Freq
1    8     1   vhf    250   7     2     10     30/01   XUWYL ax0
2    8     1   netnod 250   7     2     10     30/01   XUWYL netrom
#
#TNC Nbs Callsign-SSID Mode
1    2   KG4GIY-1      B
#
```

Once you have that all configured, and working. Then wait a couple of weeks, fix the gripes, and then wait another week and then...

6) Carefully read everything at <http://www.ampr-gateways.org/> at least three times. Now stop, go back and read everything again. If you are not very familiar with the joys of TCP/IP, 7 layers of OSI, ifconfig, route, iproute2 <http://www.tldp.org/HOWTO/Adv-Routing-HOWTO.html>, and TCPdump <http://www.tcpdump.org/>, enlist aid of someone who is familiar with the details of TCP/IP.

I modified tunnel-munge script in AX.25 HOWTO to output using iproute2 rather than route, and here is an excerpt from it...

```
as root
# MY_AMPR_GATEWAY_IP=44.??.??.??
# MY_LOCAL_RF_SUBNET=44.??.??.??/24
# /sbin/ifconfig tunl0 $MY_AMPR_GATEWAY_IP netmask 255.255.255.255 \
 > mtu 1024 up
# ip route add $MY_LOCAL_RF_SUBNET dev ax0

# ip route add 44.??.?.0/24 via 12.???.???.?? dev tunl0 \
 > proto static onlink
ip route add 44.??.???.0/24 via 128.???.??.?? dev tunl0 \
 > proto static onlink
...
ip route add 44.0.0.0/8 via 128.???.??.?? dev tunl0 \
 > proto static onlink
```

(where the '>' is part of the line wrapping, and not to be entered)

I would recommend subscribing to linux-hams mailing list or at least
reading through the archives <http://hes.iki.fi/archive/linux-hams/>
when you have problems. You also need to know about Linux Ham radio
Database <http://radio.linux.org.au/>.

I hope that helps you at least get started in the right direction.

For Sale: Sony ICF-2010 Portable SW receiver with enhanced KIWA SSB
and AM filters installed. Very good condition, includes mains power
supply and users manual. US$300 plus $10 shipping. Buy the radio and
I'll throw in a Sony AN-1 active antenna for free!

The KIWA filters make this an EXCELLENT radio for program and SSB
listening. Please see the KIWA website for specifics
http://www.kiwa.com/sony.html.

Please reply via email to wampus@nc.rr.com

Yes. Kind of makes the rest of the questions moot. You'll still need application programs to do things like your BBS, but the routing and stuff replaces half of the PC version of NOS. There are versions of these NOS's for Linux (which I assume take advantage of this fact - I haven't looked at them).

I'm looking to hook up my HP 200 LX into a PSK31 station with a PCMCIA soundcard, a rigblaster or equal, and then my ICOM 706. This will be a very small mobile PSK31 station. Has anyone tried this?? If so, some questions:

What software did you try and what were the results??
What PCMCIA Sound Card did you try and what were the results??
Any suggestions??

I know the HP 200 LX is a great little packet computer but, I want to try and go for something a little more useful.

Any help is greatly appreciated.

Hello all,

I have a MFJ-1276 Packet/Pactor tnc, with a bit of a problem. I cannot get the unit to go into pactor mode. I have followed the advice in the handbook (typing in Pactor then enter) but the unit appears not to recognise the command.

I have checked all the jumpers as per the handbook, and all appear in the right position. All the IC's in the device appeared properly seated and in the right slots.

The main system chip has release 2.2 $70c written on it, and the board appears common to the 1270/1274/1276 by the printing on it.

Does anyone have any information on this?? Is it possible that the main system chip (U23) that was supplied was one only for maybe the 1270, as the unit performs perfectly in packet.

Looking forward to any replies or assistance with this at all.

Thanks,

Gregory Towells vk2gjt

Paul, the DOS based lx series are good packet computers because they are just terminals using a TNC. I don't think anyone is running agwpe with a soundcard on them. Someone please correct me, but I'm pretty sure we need a cpu faster than 8MHz (that's 8, not 800) to run psk31. I think a fast 486 or slow pentium is the minimum needed to run psk31.

JD

You don't have to search very far ... open a terminal window and type:

```
  man minicom
```

If you are more GUI-oriented, you may like K9WKJ's suggestion better.
minicom is sort of the bare minimum. It works fine, but it gives you
absolutely no help. Personally, I'm a little more of a bare-to-the-metal
type, so I use minicom. Has everything I need, and no expensive overhead
that I don't.

..

Loaded minicom (Suse 7.3), it just quickly flashes on the screen the
vanishes! No error messages or anything. Yast2 was supposed to load
all dependencies. Too new to linux to perform any diagnostics to
identy what the problem is.

Edimax EP4000A Ethernet Adapter w/ NOS

We recently purchased an Edimax EP4000A PCMCIA Ethernet Adapter, which
is advertized
as being compatible with NOS. We attached it and ran the packet driver
that
is downloadable from the Edimax site.

So far we have been able to transmit with the card,
but have not received anything with it.

Our Problem in detail:
NOS transmits packets to nodes on the network, but does not receive the
responses, nor does it read any packet traffic on the network when the
TRACE function is ON.

We believe that we have successfully installed the client driver
PCPKT.COM because the NOS "attach packet" command can be successfully
executed and the system responds correctly to the related interface
status requests. For example, the interface status command reports the
correct adapter stats and hardware address. The card appears to properly

transmit packets on the network and network nodes are responding
correctly to these packets as observed with a network analyzer. The fact

that NOS is transmitting correctly also suggests that the NOS attach
packet command has been properly executed and the PCPKT driver is
functioning correctly, at least for outgoing packets.

The receive function, however, appears to be totally inoperative. This
is
evidenced using the TRACE function of NOS in conjunction with a network
analyzer. All network packets appearing at the input port fail to reach
the application layer.

The above "one-way" behavior initially suggests a hardware problem that
may be interrupt related. However, when the EP4000 is set up to function

with the conventional WINDOWS 98 drivers, protocols and applications,
normal network behavior is achieved.

Is anyone familiar with NOS and the PCPKT driver interface for the
EP4000A?

TIA, kwick@mitre.org

Start a terminal window (the black screen icon) and type minicom in there.

When you want something that can be run as a graphical application you can try Seyon.

Log on as root, type minicom -s to set up the default port, etc.

Go to www.cvine.freeserve.co.uk/kamplus/ for a host mode program.

Chris

the group you posted your message to is a ham
radio (two way radio hobby group) group.
ham radio deals with transmitting and receiving
radio signals from other amateurs.(fcc licensed
communication class)
it has nothing to do with digital audio hi fi ands
stereo systems, cd's or records or music systems.

Hallo,

ich will mir eine Digitalcamera holen.
K�nnt ihr mir da etwas empfehlen?

Ich hatte mir die Sony DSC-P5 oder DSC-P9 angeschaut und die haben mir
wirklich gut gefallen.
Allerdings ist bei denen Blende und Belichtungszeit nur automatisch. :-(
Die P9 hat immerhin noch 4 w�hlbare Programme daf�r.
Aber wenn man grad in der D�mmerung etwas experimentieren will - geht das
mit diesen Kameras?

Kann mir da jemand empfehlen, ob ich da lieber die H�nde davon lassen soll?
Und welche Kameras h�tten manuell einstellbare Blende und Belichtungszeit
und sind empfehlenswert?

Vielen Dank f�r eure Tips,
Raik

Hallo!
Ich empfehle die Minolta Dimage 304. Die ist zwar nicht gerade sehr klein,
aber fast alles auch manuell einstellbar.
Und f�r einen rel. g�nstigen Preis(500-600Euro). Schau mal bei
Digitalkamera.de.
Gruss
Cris

Yes, and no mod required. You use split frequency. Put the receive freq. in the A VOR in cw mode and use the B VOR in USB for the send side. You must increase the frequency in B VOR by appx. 85 Hz. to compensate for the offset in the CW mode. Refer to your manual to see how to do split frequency. It works very well.

Hi Robert, it's great to hear how much fun PSK31 is to discover. You might
be interested in having a look at my Remote WinPSKX ActiveX control
experiment. The writeup is at http://www.netdave.com/wa0ttn/WinPSKXRem.asp.
I actually kind of lost interest in it after I proved the concept. But it
does exactly what you described, for the very same reasons :-)

73,

Fuji FinePix 6900 Z

- Automatikprogramme
- Vollautomatik (shiftbar)
- Teilautomatik
- Zeit Manuell
- Blende Manuell
- Autofokus
```

- Man. Fokus (aber nicht sehr hilfreich)
- ext. Blitzanschluss
- hochwertig verarbeitet
- SuperCCD-Chip (super Bildqualit�t)
- el. Sucher und hochwertiges Display

F�r manchen ist die Verwendung von SmartMediaCards als Nachteil zu bewerten, ich hatte damit allerdings kein Problem. Mit dem optional erh�ltlichen Ladeger�t sind die Akkus schnell wieder voll. Das Display ist leider nicht schwenkbar, aber auch damit kann ich gut leben.

Die Farben kommen realistisch. Die Umschaltung auf verschiedene Lichtquellen ist sinnvoll. Der automatische Weissabgleich funktioniert bei Tageslicht einwandfrei, bei Kunstlicht sollte man selbst eingreifen.

100, 200 und 400 Iso sind als Empfindlichkeit m�glich. K�nnte �ppiger sein, man kommt aber gut damit zurecht.

Das eingebaute Blitzlicht ist ... naja, kauf Dir einen Metz dazu und du bekommst sehr gute Ergebnisse.

Im analogen Bereich setzte ich eine EOS 3 ein, meine Qualit�tsanspr�che sind damit wohl dokumentiert. Im digitalen Bereich habe ich einiges ausprobiert und am Ende bei der Fuji geblieben.

So, ich hoffe, du konntest damit was anfangen.

Gr��e
Dieter

I'm still relatively new to packet and APRS, so I'm not familiar with all of the commands that exist in the APRS protocol. Hopefully someone can help me out with a few questions that I've come up with over the last couple of days.

First, can someone explain how to "ping" another APRS station or an APRS digipeater? What I mean by "ping" is that I'd just like to know whether or not my signal is being picked up by a specific station or digipeater. Also, if I'm operating my mobile APRS station from a location where I'm not sure of the digipeater layout, is there some type of general "ping" message that I could send out to see if there are any other APRS digipeaters in the area?

Also, in looking at APRS messages that have come across my station, I've noticed two words that are occasionally used in APRS address lines, "BEACON" and "TCPIP". Could someone please explain these and how/why they are used in an address?

Thanks!

If my understanding is correct......

If TRACE is included in a station's UNPROTO path, the command ?PING? can be sent in a message to that station, and the return path will be sent back as a reply.

I am sure someone else can give a better description.....

Hi Indy465. The place to look for answers to all your questions is the
full APRS Protocol Specification, at:

http://www.tapr.org/tapr/html/aprswg.html

Well, here's the deal.

I have an IC 756 ProII. My rigblaster was working, but my old rig,
and computer got zapped by lightening last year. Rigblaster continued
to work but quit about a month ago...replaced the connector to the
righ (8 pin mike connector). Vox and footswitch both work fine when
mike is connected to rig.

When mike is connected thru rigblaster, the vox works fine. However,
the computer wont trip the transmit to send audio to the rig. I tried
a different 25 pin RS232 cable between computer and rigblaster. Config
is set up for com 1 which is correct com port. Soundcard on computer
is putting out plenty of audio.

Anybody got a solution? Thanks

Bob/WF3H

I need some help with my PK-88.

I'm trying to get my packet station back on-line and
I'm having a problem with the TNC.

A while back I had a problem where the TNC locked up.
After trying several fixes a friend said to do a hard reset
and maybe that would take care of it.
Well, now the TNC won't work at all.
When I turn on the TNC I get the standard command
asking for a * to set autobaud.
When I give it the *, nothing happens.
I've tried it with 2 different PC's and get the same
result.

Anyone got any ideas of what's wrong, besides an "Operator Malfunction".

Thanks in advance for your help.

Ron, no worries! Wait until you get this thing stuck in MULT mode. Then its kinda a pain to get it back to the cmd mode. Anyway. Try using HyperTerminal in Windows to do this. At the CMD type in RESTART, if all goes well, you should get something like this....

```
AEA PK-88 Packet Controller
AX.25 Level 2 Version 2.0
Copyright (C) 1986-1991 by
Advanced Electronic Applications, Inc.
Release 23.AUG.91 *
```

But, if it goes into MULT mode, download PKDEMO.exe from www.qrz.com/PKGOLD/ unzip it and run the program. When it ask you if you want to hear the tones, hit no. then it will ask you if you want to initiate the TNC, hit yes. and follow the instructions. it will take about 5 seconds for it to re-initialize the TNC and it will be back to normal. Go ahead and

use that program for packet. Its a nice program, but only runs for 30
minutes. after you get it fixed you can use other packet programs without
worry. if the TNC locks up again, use PKDEMO to fix it. This is what I had
to do a month ago and another ham on another newsgroup had the same
problem.. He reported everything fine when he tried PKDEMO. So, good luck
and give me a holler if you have anymore ???'s
73's!
Mike

I think you need to use the * on the keyboard not the number pad for
autobaud. Hold the shift button and hit the * several times.

Sorry in advance to any purists but can anyone suggest a good piece of software that will both allow you to receive and decode CW into text form as well as type (the person using the software actually uses a modified keyboard for one-hand use similar to a 'stenographers' due to a disability) on a keyboard that, via the appropriate serial interface, will key the radio?

Obviously the software will decode the CW audio into character form on screen.

I've seen CWType and CWGet but they seem to be seperate programs - I need one that will do both jobs.

My friend likes PSK31 and RTTY but would also, via his adapted keyboard, also like to send and receive CW.
Restricted and often 'shakey' hand movements now cause him problems with either a straight key or paddle.

All help appreciated.

Leigh....M5GWH, UK.

It IS stuck in MULT mode.
I treid to get PKGOLD but it's not on QRZ anymore.
Any idea where I can find it?

I'm running paKet 5.1, I've had it for years
on 2 different PCs.

MixW does CW, PSK31 and RTTY plus lots of other modes. It includes both send and receive on CW. Your friend may be somewhat disappointed with the receive results, however - hand sent CW is very hard to decode accurately with a computer and the quality of the results is often very poor. MixW does as good a job as anything else that I have seen, but I can still do better by ear and I am just an "M3" ! It is shareware, not free, but you can download a 30 day eval from www.mixw.net and the registration fee is only around $50 - well worth it...

That's because the folks who brag on their CW have bad fists ... :o).

Yes this is a shameless troll not worth replying to.

I recently upgraded our hi profile Kantronics digi station to firmware 8.2 from 7.0.

I cant find any info on this WIDEn-N stuff. What is it, and how does it work. And what do I have to do in the setup of the Kantronics to make it work for us.

I searched the web the best I could, so even a good web site would be great.

Thanks much.

Hi;
I want a TNC for my vehicle which will run Packet on 2 Metres and Pactor on
HF that uses the same port for the HF and VHF rig, and a single serial port
to the PC. I run an FT-100D with a data port, and an IBM Laptop.
I use Airmail for Pactor and UI-View for GPS-Packet. I wonder if the HS
Switch for the UI-View would have to be removed to run Pactor, or will the
software ignore it?
What would be a good TNC to use?
Any ideas?

Anyone ever have this problem? I'm running a Tiny-2 (version 5.0 firmware) TNC with a Magellan GPS315 connected to its serial port, with the NMEA 183 ($GPGGA) mode activated and sending GPS sentences. Bauds are properly set, and all seems well. Yet after about an hour or less, the TNC no longer updates the posits and shows me at the last posit that it cares to hold for whatever reason:

http://www.findu.com/cgi-bin/find.cgi?n6xqy-12&radar=***

shows me somewhere I was hours (or days) ago, even though the packet may have been transmitted minutes or seconds ago. Even stranger, every so often, the old stale posit is actually updated to a fresh one, which is then held for another eternity. The TNC faithfully send my LOC as instructed, but the GPSTEXT doesn't get updated. It seems that the TNC is interrupting the data stream from the GPS arbitrarily, and I can't find a cause. Anyone have any ideas? I've replaced the GPS serial cable and null modem cable with new, but no luck. I have found that the GPS will halt sending data via the serial port, possibly due to the TNC, but reinitializing the GPS starts the data flow again. Pac-Comm must be tired of my calls by now, and Magellan can't figure this one out either (they just discovered APRS from my phone calls). Any guidance here is appreciated. All I want is mobile APRS...

Who? Me (the original poster) or vito@crosslink.net who added a follow up?

If me - well - gee thanks - my original question is 100% genuine.

I've got the answer I wanted - MixW - and the ham who I was posting for has now got his interface running and should be going with MixW soon.

Leigh....

I have received data on the national APRS frequency, 144.390 at 9600 baud and 1200 baud. I use a Kenwood TH-D7(G) HT, connected to my laptop via a serial cable and I use either APRSpoint or APRSPlus+SA to see the data on a map. However, when I use either APRSPoint or APRSPlus+SA, I can only see data at 9600 baud on the laptop.

I use MixW for CW sending and receiving. It is excellent and allows me to keep up with some of the speed demons. If you license the program, use the 1.x decoding method as the 2.x method is not as good.

Regards,

Duffy - WB8NUT

I have tried them all. I have found that HamScope performed the best. It was able to decode more often and has loads of macro functions available to save you time for common qso info.

MixW will accept a CW key (or keyer) via the joystick port, so it can
directly see the CW you are keying by hand. Will it decode it?

With HamScope your key has to be plugged into your radio. Will

HamScope decode the side tone your radio generates when you TX CW?

The point of this is to be able to log entire CW QSO's where a
keyboard is not used.

hi all of you,
well what i mean about the doppler effect is different depending of your qth
versa the iss qth.
here in eastern quebec,canada when she is passing over it goes very fast.
any way ,we see some traffic on packet but it is so quick
i am beginning to gave it up!!!!!!

The iss appears to be dead on packet. Look at
http://www.findu.com/cgi-bin/ariss/index.cgi
That's right, (at this writing) 22 days, 9 hours, etc...

The general idea is uplink 145.99, downlink 145.80. 1200 afsk/FM. I've
popped it on 1 watt with 50 feet of coax, and an old MFJ quarter wave GP.

In theory it's like shooting fish in a barrell. The downside is that the
passes
go by pretty quickly.

Wonder if anyone here might be able to shed some light on this:

No matter what icon selection or SSID I use on my TH-D7 handheld when running in stand-alone APRS mode, when I transmit back to my home station running WinAPRS (version 2.5.1) and a TNC/radio combination, the TH-D7 will only show it as a a red dot, which when hooked indicates a mic-e icon. I see that the beacon text of the TH-D7 has a mic-e statement in it, could this be the cause of this, is it overriding the selected icon? If so, how can I fix this so that WinAPRS will show the handheld as whatever icon I choose?

Any help would be greatly appreciated, as I'm at my wit's end trying to figure out what I'm doing wrong!

73 es thanks,

Fred N2FOZ

I was wondering if anyone could tell me if there is a monitor frequency for 2m packet contacts on field day? If not, how does one get digital contacts, short of coordinating them?

Hey gang.

Does anyone know the frequencies currently in use (active) for TCP/IP in the Sacramento area.

I have found none of the NCPA frequencies active in the area and am interested to know if anyone is currently using the mode.

Thanks in advance.

Dave

Just curious. AYAK Prisoners and others use tap code, not morse, because
it's all "dots" (no dashes) and doesn't require a long learning curve;
just a simple 5x5 matrix with 'c' substituted for 'k'. Is anybody using

it on amateur bands in lieu of Morse? Any read/write SW around.

Please read the original message. I was asking for frequencies that are usually
monitored for ***2 meter*** packet on field day.

No, we use PSK31. No learning curve at all, just use a PC.

>I see that there is 1200 baud, 2400 baud, and 9600 baud packet.

1200 and 2400 are usually sent using AFSK (2400 with higher tone freqs).
9600 is sent using FSK, so there is one (de)modulator less. However, there
is a scrambler between the demodulated FSK bits and the NRZI layer.

There also exists a 2400 bps PSK system, but I think it is rarely used.

In Canada and the Netherlands a 4800 bps ternary FSK system is popular.
(HAPN 4800 baud modem by VE3DNL and others)

It's the way you're using them. On the highway, with the limited range, you WON'T find many other users. Even around Boston. (I'm below Worcester.)   I've used FRS between multiple cars to the cape and to ski trips, and never run into someone on the highway.

On the other hand, I took FRS on a motorcycle trip. And stops up north of Lowel found a couple of channels busy. On ski trips to Vermont almost every channel is so busy as to be almost unusable. Going to things like NHRA (big events with top fuelers) FRS is one big party line. Even with PL.

Hey, even in the summer, when I was at the summit of Wachusett, I found about half the channels active. A lot from there, but I was also getting some pretty distant stuff. One conversation was hikers. Sounded like they were on Monadnock.
Mike

```

> experimental use. It became that way by default. Because of laziness as a resault of a well-known-inside pizzing contest between certain managers at the FCC - it was easier to just nake thw rules conform to what the outlaws were doing than to enforce them.

No arguement there. You are correct, but it doesn't change history. Be that as it may, the CB band, the FRS band, and I'm sure the MURS band are open to be used by THE PUBLIC, for whatever usage they seem to see fit. GMRS is also (sadly) heading down the same road, now that blister-pack GMRS radios are available to clueless people that think they are just higher powered FRS radios.

>
> The GMRS and the FRS and the MURS were never intendced to be for hobby or experimental usage. But alas, the same throwing-up-of-the-hands that overcame the FCC with the CBRS overcame them for these, too.

They were never intended, but nonetheless are, the cheap and dirty way to play with radio without taking a test.

>
> FRS was a pet project of Radio Shack to sell lots of junky throw-away radios

Some would say Motorola also had a stake in this.

> and MURS was a pet project of EF Johnson to sell more JobComm radios than its competitor could sell Color-Dot radios which both were selling when a Business Radio License was required for their usage. But the outlaws walked into CostCo or Wal-Mart, bought the radios and used them unlawfully and the FCC again changed the rules rather than enforced them.

That seems to be a common thread for the FCC. "If you can't beat 'em, change the rules". Had the FCC's presence been stronger, 25 years ago, we wouldn't be having this conversation. But it's water over the dam now.

>
> If you think that these companies had the good intentions of "making communications more accessible for the average person", I have a bridge for sale that may be of interest to you....

Oh no, I'm far from naive. Any commercial venture has as it's primary goal, the advancement of their profits. Clever marketing types will look to find any new niche, that they can exploit for monetary gain. Why do you think companies like Uniden and Yaesu, made ham radios that (Wink wink) could be easily modified for 11 meter usage? That was no accident, and their sales demographics proved it, even though they ended up flooding the market with gear that was destined for illegal usage. But their bottom line was much better....

>
>   Wanna do hobby? Wanna do experimenting? Get a ham license....it's
>   much easier now than when the CBRS and GMRS were first founded.

Seems almost too easy doesn't it? Why would someone play arounf with services like MURS, and FRS, when ham radio offers so much more? The theory test is disgustingly easy these days, so there's really no good technical reaason why someone would not go the ham route.

But many seem to harbor a deep rooted hatred for hams and the service in general. This is likely due to bad exposure to "stuffed shirt" types that feel that "real hams" operate DX on HF with at least 75% of all contacts on CW. The bad taste left has turned away many prospective radiko hobbyists. Maybe that's why there's interest in these other services.....

I agree that there always will be some that have no desire to leave the
11 meter band. But there are also others that like to test new waters.
Many upgrade to ham radio. Many find other avenues.

In my opinion, the only reason that GMRS has stood the test of time, is
that the service was not (Until very recently), widely marketed to the
public in places like Wal-Mart. Gear for GMRS was largely made up of
converted business radios, which are fairly expensive, and not always
easy to find, unless you cruise around in the radio world. In other
words, you had a need.

CB was also not very popular before the 70's, when the mass media
coverage of the "convoy" phenomenon, catapulted CB into every household,
and many companies started cranking out radios and selling them in
places like auto parts stores and 5 & 10 stores.

What will ultimately kill GMRS is the increasing marketing of cheap
"bubble pack" radios, with the predictable resultant rise in illegal
activity. The FCC, will once again run rather than fight, and will most
likely deregulate the band, and that will be the final death knell for a
once usable band.

I guess that's why there is at least a 5 year wait to get a repeater
pair coordinated on 2M even in the rural South.

As someone once said, "Well, there you have it..."
Straight from as prominent an authority as you will ever find on rrap. Ham
radio testing today IS much easier today than before.

Thanks for the information Rob.

How is demodulating an AFSK signal different from an FSK signal?

When I tune a receiver (properly) and sample the IF of an FSK signal
the "center" or 0 Hz of the signal is between the two FSK tones.

I assume in the case of AFSK, the two tones are riding "above" the AF
carrier. So in order to demodulate the tones I have to shift them down
to baseband so I can recover the clock and look for zero crossings?

Do you have a better technique?

Thanks!
John

That's fine, as long as they leave 6m, 2m and 70cm alone, I'll be happy. :)

news:<5f4fe4c2.0205291611.57a1a424@posting.google.com>...
" This is why we haven't been seeing this kind of activity on GMRS/FRS/interstitials. If this high-powered amplifier activity were REALLY occuring on these services, wouldn't you think the UHF and VHF amps would be being sold right there alongside all of those HF amps at the truckstops?
Stewart - N0MHS.......

It is happening "Big Time", but the "rule breakers" in this case aren't likley to ever go to shop at truckstops or be "Truckers". The Loads of people into running high power/unlicensed equipment at FRS/GMRS/MURS are most likley to be people that have more of a "purpose" for a semi-closed PL (ctcss)/DPL radio like MURS/GMRS/FRS. These include loads of Amateurs that are using these radios to communicate with the rest of their family & friends, the ones that had no interest to jump thru hoops to take a Federal Amateur test, just to play with a radio twice a year, also Scanner buffs, & the "cop/fireman wannabees" that show up with a radio &/or camera on their belt at a fire scene, but really don't belong to any law enforcement agency (EVERY Cop or Fireman knows these guys WELL), also People that started out in legitimate FRS, & then found out about higher power radios that can be programmed to work with their existing handhelds.

Believe me, you may want to believe that EVERY "bad guy" is a trucker, & every illegitimate use of any radio service will trace back to a Truck driver or Truckstop, but that is a stupid conclusion.

Hi Doug,

I can and would be able to help you out. I have an programer that should be able to handle what you need. Reply to my Email address below, taking the NOSPAMPLEASE out. I will program for free, small quanities of Eproms & EEproms for Amateurs and Experimenters. You just have to pay the postage both ways. Most people send their chip(s) to me with a prepaid return sase type envelope.

cheers
skipp@pilotNOSPAMPLEASE.ucdavis.edu

: Doug Gavilanes <gavilan1@earthlink.net>
: Greetings. I have a just few eEproms (bought from Pac-Comm) trying to
: run some Pac-Comm Tiny-2 TNCs, also bought from Pac-Comm, but for some
: unknown reason, the TNC will reset and the eEprom will lose all user
: parameters and revert to default settings. This takes me off of the
: air, as I'm trying to use one for APRS, but I can't keep one up for more
: than a day or two before the default settings reappear. I have spent
: hours with them on the phone teching the problem, with no success. Does
: anyone out with a programmer for this old IC have the ability to reburn
: this eEprom with my user parameters written into the default, so that
: when the unit resets, it will still be in an "on the air" capable APRS

: mode? I need to edit in about 12 settings or so, and since I bought
: these eEproms from the TNC manufacturer, I don't believe that editing
: and reburning the eEproms would be infringing on their copyright. Any
: help here appreciated. Please reply via e-mail to
: gavilan1@earthlink.net.

AFSK is 2 levels of FM. You have to demodulate it two times.

Ham amps don't tend to be intentionally set up to splatter across half
their band.

Unlike CB amps that are "intentionally set up to splatter across half their band"? Do the CB mags run articles on how to intentionally set up an amp to splatter across half the band? Is there a splatter per MHz spec for 27 MHz stuff?

You have to love this hobby, you learn something new every day. Thanks Joe for carrying on the ham radio tradition. The world most certainly is our oyster!

73,

Glenn

I've just had some interesting and informative email correspondence with Sylvan Butler, N7OWL, about gelled vs absorbed-liquid (AGM) sealed lead acid (SLA) batteries. I had commented that batteries with gelled electrolyte are rare, despite the fact that amateurs call all SLA batteries "gel cells". Sylvan had disagreed, saying that gelled types were common and AGM types rare.

This, and our correspondence, prompted me to do some web searching, and I came up with the following:

One of the batteries I see very often is the Panasonic SLA. Its electrolyte system is described at http://www.panasonic.com/industrial/battery/oem/images/pdf/slaover.pdf. It's pretty clearly AGM type and not gelled.

Sylvan and I both agree that one of the most common SLA batteries encountered is the Yuasa NP series. He had taken one, or a similar battery, apart and found gelled electrolyte. But Here's what the Yuasa web site says about the NP series, at http://www.yuasa-battery.co.uk/NP_Batteries.html:

"All NP batteries utilise Yuasa's unique electrolyte Suspension system incorporating a microfine glass mat to retain the maximum amount of electrolyte in the cells. The electrolyte is retained in the separator material by miniscus effect and there is no free electrolyte to escape from the cells. No gels or other contaminants are added."

The vent is described:

"The batteries are equipped with a simple, safe low pressure venting system which releases excess gas and automatically reseals should there be a build up of gas within the battery due to severe overcharge. However, on no account should the battery be charged in a sealed container."

I downloaded the Yuasa NP manual. It uses slightly different wording to describe the electrolyte system:

"All Yuasa NP batteries utilise an electrolyte suspension system consisting of a glass fibre separator material. This suspension system helps to achieve maximum service life, by fully retaining the electrolyte and preventing its escape from the separator material. No silica gels or other contaminents are used."

So it's clear that the common Yuasa NP series is also AGM and not gelled electrolyte type.

In email, Sylvan commented:

I agree.

But I do know I've taken apart several defunct SLAs and found a pudding-like substance (usually visibly dehydrated and cracking) inside, under the epoxy or tar seal.

Looking at the www.yuasa-battery.co.uk site, they only mention AGM types of SLAs. They also refer to their "NP" family as "a new generation". I wonder if they used to sell gelled electrolyte a few years ago, but now are not?

There are a lot of advantages of AGM compared to gelled, so discontinuing gelled and replacing them with AGM would not suprise me. The only disadvantage would be cost, and that may be somewhat mitigated if (as some nations require) the manufacturer is accounting for end-of-life recycling.

--------end of comment-------

With at least the popular Panasonic and Yuasa types not being gelled, I'll stand by my statement that truly gelled electrolyte SLAs are uncommon, although they certainly do exist. Does anyone know of a relatively common type of SLA that really does have gelled electrolyte?

>How about 1 year (I think).

  FRS was created by rules effective July 8, 1996.

  MURS was created by rules effective November 13, 2000.

  GMRS (Formerly Citizens Class A) has been around for about 50 years.

:
: I've been using them for nearly 15 years here and no problems. Car
: batteries hold up fine as long as you don't overcharge them, don't let
: them discharge too far, and keep the water up in them. But I do prefer
: a marine deep cycle if I had my choice as their design suits radio use
: better. But a car battery will work just fine. I'm running a 706 on
: one right now. I use a fully automatic charger to keep the charge up,
: but a trickle charge will work fine as long as you remember to unhook
: it when you have a full charge. Heavily discharging a car battery will
: greatly shorten it's life and capacity. All long as you avoid that,
: you won't have much trouble. A deep cycle can handle heavy discharges
: better, but even with those it's best not to heavily discharge them. I
: never heavily discharge any of those lead acid batteries on purpose.
: Sometimes it'll happen though out portable etc. If I buy a new battery
: just for radio use, I get the big marine deep cycles. MK

Here's my experience:

I find that I have had to replace stock Automotive starting batteries about 2:1 when compared to Marine Deep Cycle batteries.

I have had good life with Gates cells even though I have only bought used ones. All of gells (or whatever) are pulls from UPS service, and either they are good and I get a few years use or I pitch them. I have a couple that claim to be sealed that didn't have as much life as the sealed Gells (says "GELL" on the side) that were 5 years old when I got them.

Currently I have 7 years on a Nautilus group 27 Deep Cycle Marine in the trunk (in a box with a fusible link) that pulls all the radio gear with the key off and has still outlasted 2 "premium" 72 month batteries in the front of the vehicle. Before I went to dual systems my battery life on the front OEM and Premium batteries was even worse. Even when I was buying the best that could squeeze into the space.
I can't count how many Die Hard and JCPenny batteries I fried when I was running around with Motracs in the early days.   If only Radio Shack had them on the "free battery a month" cards along with "lifetime" tubes.

Jim, ac6tk

Can you name anything associated with technology in any form that has not
advanced or progressed over the years?

> All those Hams who could build a radio, are dead and gone.

Pure baloney.... there are a ton of them, I can name quite a few right in my
"own backyard" as it is. (And some of these are not the old timers either)

>
> What that leaves, is the Hams who like to interface things to a
> pre-built radio. There is a lot of experimentation and fun in doing

> those projects.

Who's fault is that? Could it be the manufacturer's? I cannot buy enough parts to make a "decent" rig even 1/10 of the quality and stability of today's rigs locally here where I live. Christ, the manufacturers are also responsible for the virtual death of some of the VHF and above bands.

>
> Radio is not the fascinating thing it was in the 60's and before.

> the same place that model railroaders, and slot car racing went.
>

Hmmm.... the numbers have (for the most part) gone up every year. Granted some years were definitely not as large in growth as others, but almost every year for the past 20-30 years has appreciated some level of growth, not decline. If there is a death in ham radio, it is going to come from lack of promotion on a national level down to the local/club level and of course the personal level. If we also spent as much time whining about what is supposedly so shitty about ham radio, and spent that time educating prospective hams and new hams we would have a greater growth that we currently do have.

> Hobbies die, and people die. MURS is still-born.
>

That is true if you want them to, or a person can be proactive and work for positive change or at least to keep things at a even keel.

Ryan

Try again, I have in the past built a lot of ham gear, some from
kit, some completely homebrew and can still do it. Just because
you are incapable of building something doesn't mean everyone else
is also.

Isn't there a "commercial" Yaesu model HT that is/was marketed for the
155's and 460's which looks like an FT50RD? I thought some of the
vendors were closing out battery packs for those a year or so ago,
seliing them as spares for the FT50's etc.

A very narrow look at this!  The men you quote all were for laws.
They were just for laws that was balanced by representation!

Talk about spin!

Common misconception... just because they are allocated, doesn't mean they are
used.

Wrong newsgroup. That device has nothing to do with radio.

Thought it was 300 bd on HF?
There was feature in MSYS where you could beacon in APRS format.. that was 300 Bd

Well, time will tell. While I don't expect kilowatt stations to take over GMRS, there will most likely be a vast increase in the "noise level" on once quiet frequencies.

The whole CB "phenomenon", is mainly made up of a bunch of different people, looking for different things. GMRS lacks the DX potential, so those type of people will not be attracted to GMRS. But people looking to broaden their radio horizons (without having to take the "cursed" ham test) may be attracted to this alternative.

The people who will be attracted to GMRS will be the same people that became interested in FRS, namely those who want clear quiet communications, or who want to yack it up with the locals. The range on FRS is a bit dismal, so the allure of higher power GMRS radios (not all of which are handheld), may be enticing.

Since most legal GMRS users belong to a community repeater system to get the best coverage from their handheld radios, illegal GMRS users, will have to "Go it alone" on simplex. The only alternative to a repeater system, is to run higher power. With UHF, terrain makes a big difference, and high power doesn't always guarantee a huge jump in range, but that won't stop some people from trying. Higher power is a bit more expensive at UHF frequencies, but I wouldn't be surprised to see people running power in the 100 to 300 watt range.

But like I said before, time will tell..

Dave

I suppose this is the right group to post the following question: I have a large sellection of gramophone records, some of them very rare. Now that record players have come out of sale and fashion, I am thinking about transferring some of my favourite records to CD. That means going from analog to digital. Has anybody tried something similar and not too complicated? I am quite at home with electonics and ready to solder up the necessary equipment. Any suggestions or experience so far? Thanks,
Bozidar

Your stereo system should have a 'tape out' jack. When playing records on your system this will be the correct output level from these jacks to feed into your 'line in' on your computer's sound card.

There are many free applications which will permit you to record this to wave files or even to mp3 files. If you record to mp3 you can achieve a 10 to 1 compression permitting you to put 10 hours of stereo music on a single CD.

The paid version of EZ CD Creator also includes a function to remove the click and scratch sounds.

If you have a lot of records this is going to take a lot of time!

Ron

Hi everyone.

I've been playing around with AGWPE on my desktop and laptop for the last couple of days with quite a bit of success. I have been having problems, however, with AGWPE detecting incoming packets from my radio. Here's the situation that I've been experiencing with both my laptop and my desktop. When using AGWPE, it appears as though the program is detecting about half of the incoming packets and ignoring the other half. When I hear an incoming packet over the computer speakers, there's about a 50/50 chance that AGWPE will detect the packet. Interestingly, I can't hear any difference between packets that AGWPE will detect and those that it won't. The packets that aren't detected by AGWPE are received at the same volume and signal strength as those that are detected, so I can't quite figure out what's going on. By the way, to judge whether AGWPE is detecting a packet, I'm looking not only at the green indicator on the TNC symbol in the menu bar, but also AGWTerminal which I'm running to verify that those packets that are being detected are being displayed properly.

Thanks in advance to anyone who may have some suggestions!

Using WinPack and APRS with AGWPE ,I don't seem
to have that problem. However, from time to time I have
to re unzip and reinstall as some other strange things will
happen. I am of course using a sound-card program.
Luck :-)

Howdy all,

I bought a Rigblaster Nomic sometime back, but hadn't gotten around to actually hooking it up until recently. Last Friday I built a computer out of spare parts I had laying around (P II, 64 mb ram, 4 gig HD, Win ME). Sat it next to the PC, with the intention of using it primarily to look up call signs on the net while scanning the bands.

While I was at it, I hooked up the Rigblaster, downloaded and installed Digipan, and gave PSK a try. Now I'm an addict! Since Saturday night I've worked 7 new countries plus several stateside contacts, on my vertical antenna using 30 to 50 watts of power. Absolutely amazing! All in probably 3 hours of operating time, max.

Want to try out some of the other digital modes, but at the same time having so much fun on PSK don't want to stop!

For my next trick I want to install some remote control software on my ham PC. Then I can take my laptop to the living room or back porch, hook my it up to my home network and use it to take control of the ham PC. Then I can do PSK from the comfort of my couch, or while out on the back porch enjoying the nice weather!

Anyone have any tips or suggestions for a new PSK addict?

And are there any PSK nets?

73's

Robert / N4IXT

I couldnt find a SIG dedicated to ACARS operation, so i figured if i ask i
might get help

is it possible to use the kenwood th-d7ag or tm-d700m to decode ACARS
transmissions on 131.550 in AM mode.

I can do it with my TNC and the audio out on my scanner

any help would be appreciated

Hi Ron!
Thank you for your prompt answer. Your information is very useful. That
is all I need. I am retired, so I have enough time to save my favourite
music. Best wishes,
Bozidar

The Essex Packet Group are putting a Node at my QTH and we need help
in getting some S/H TNCs (TINY-2 or BSX) that can have a JKISS EPROM put
into it so that it can run on a BPQ Node?

I really don't want to get new ones, but I will if I have to.

If you can help, please reply or send an direct e-mail.

Thanks ever-so-much...

Hi all,
i have made an interface for TS940 + Sound Blaster that supports A/FSK,(may be simply modified for any rig) works great, and finally stopped all the problems dure to ground loops, keyboard look and so on...
For wiring diagrams and info, a look at http://www.ik3qar.it on "RTTY" section.

Hope it will be helpful.
Please add any critics, comments suggestions are appreciated!

Has anyone figured out a way to use the narrow filters of the TS940 in the digital modes (using AFSK, etc). Is there a mod available?

Right now you can only use the TS940 narrow filters in CW and FSK. Not very good for PSK31, etc.

73
Rob

I think you need better research... here I did some, myself:

Doc said on 5/3/2000:

As the 'old' saying goes, "If you can't do
the time, don't do the crime." ('Baretta' had it right
as far as I'm concerned).
                 'Doc/W5LZ (ex: AA5AN)

Nice 'hero' model, 'Doc. Maybe you need a new role model. BTW, I
think Baretta's 'new' saying goes something like; "If you can't do the
time, get a good lawyer."

The discussion was really about "high-powered amps"; it is VITUALLY USELESS to use high-powered amplifiers(>75W) in the context of LOS MURS. Rather than restating the whole premise in each and every post - I've posted the entire premise in another thread... the point is - people simply haven't been using these amps on UHF GMRS/FRS or VHF Itinerants in all the years of the existance of these services - why all of a sudden would anyone think they are going to start to use them now?

Stewart - N0MHS

Hello all...

I have been away from digital hamming for about 3 years now, and have recently needed to get back into the swing of things. We are taking a very long boat trip, and need the following capabilities:

1- WEFAX

2-PSK 31

3-PACTOR

I have an AEA PK-900 for the Pactor, which will be used for email (airmail) (Nope, not spending 600 bucks for the Pactor II capable SCS modems...) , Unless someone knows if they have figured out a software method of doing pactor (which I doubt, I recall some kind of timing problem?)

Wefax for weather, of course, software recommendations needed.... and PSK 31 software recommendations also (I've used Digipan, loved it... what's the latest version and where is it located?)

Thanks for all your help, Computer on the boat is an older
(expendable) laptop, 2 gig drive, 80 meg ram, I think a Pentium 2 at
175 mhz... Radio will be an Icom 710 and a Yaesu 900.

Thanks in advance folks....

MW

stewart,
It's not progress you're talking about, it's
only change. Change, just for the sake of change
is one of the stupidest ideas going. If your ideas

had any merit, that would be different, but they don't.

As to the code speed reduction, how would you possibly know what my feelings are about it? I've never expressed them to you, or this NG. If you knew what they were/are, it might suprise you. And what new 'novice' class are you talking about? The one you proposed which was rejected, or did something happen and no one told me about it? I think you're mixing fantasy with reality Stew.

Do I have faith in my fellow Americans? Yes I do, but what has that got to do with what we're discussing? Just more 'smoke', and trying to focus on a totally unrelated topic. You've really got that 'politician two-step' down almost pat!

'Doc

PS - I still think you need help Stew baby...

I would second MixW - it does almost all the modes in common use

at least reasonably well and PSK very well. Not so great at SSTV -
it will let you try it out, but get a more specialist package if you want
to take it seriously. It also integrates well with several other important
ham packages for logging etc.

My receiver doesn't supply FM demodulated audio, so I'll write an FM
demodulator along with an FSK demodulator to produce the bits.

I see that there is 1200 baud, 2400 baud, and 9600 baud packet.

In the US on 144.39 is APRS *always* 1200 baud?

Thanks,
John

MixW32 is a good program but it is shareware $$$.

You may want to check out hamscope at http://users.mesatop.com/~ghansen/.
It is a pretty good program that supports the popular digital modes like
RTTY, PSK31, MFSK , CW, Packet and ASCII.

Hamscope also integrates with popular logging programs like DXbase, Logic6,
RYLogit, TRX-Manager and YPLog.

Best of all, Hamscope is FREEWARE!

Rob

This will come as a shock to the many folks who have worked all continents on HF using milliwatt QRP transmitters.

>However, on VHF/UHF frequencies, greater than Line of Sight(LOS)

Right, CB'ers would NEVER think of running amps on FRS.......

> What's the URL for the web site that sells the linears that work on
> the FRS channels? I'm looking for about 250W out.

You might do a web search for "T-E Systems."

They make high power amps for VHF/UHF ham
applications. They may have an amp for the
450 MHz FM ham band that makes that much
power and only requires a few watts of drive
power. Hopefully you have an early FRS radio
that had the potential to make more than 3/4
of a watt. If not, you'll have to start with a low
power amp, see what the output is, and then
buy a suitable high-power amp designed to deal
with the amount of drive power that the low-power
amp produces.

Good luck.

> absolutely no basis in fact.

But it does have a basis in history, and human nature, together with a declining morality standard, and a general "up yours" attitude.

> The motivation for spreading the rumor is somewhat complex - but, the main motivation appears be to maintain some kind of "superiority complex" these hams harbor over "CB users".

And how does one do that? Whether or not one operator is "superior" to another would be easy to discern based on their overall achievements and their dedication to their respective service. One does not need to promote a superior attitude. The facts will speak for themselves.

> A secondary motivation seems to be to stop the growth of these wildly-popular radio services - as ham VHF/UHF usage has continued to decline in recent years, these services are rapidly growing in popularity.

Why would hams want to purposely halt the growth of another radio service? For what gain? As a radio hobbyist, I welcome any and all outlets for experimenting.

>
> There has never been a reported violation involving amplifiers on any of these VHF/UHF frequencies; and, the fact is, there is simply no real motivation for the average person to use amplifiers on these frequencies.

How about the "entertainment" that you spoke of, of "squashing" other stations? How about for inproving their distance? How about the same motivation that pushed most high powered Cbers, and that is the "king of the hill" syndrome?

>
> THE BASIS FOR THE LEGEND:
>
> Illegal amplifier use on 11m CB frequencies has been an ongoing problem for many years. However, the dynamics of radio wave propagation on HF CB vs. VHF MURS or UHF FRS/GMRS are quite different. Sky wave, or "skip" propagation is commonplace on HF frequencies. To take advantage of this propagation requires running more than the legally-allowed 4W output allowed on 11m CB... as a result, many truckers(and other citizens) have resorted to using illegal amplifiers to raise the output of their radio stations to outrageosly-high values; 500, 1000, 1500, even 2000 Watt amplifier use is commonplace - allowing these individuals to communicate great distances(sometimes 1,000s of miles when the "skip is in").

So you think that "skip" is the sole reason that CBers run amps? You obviously haven't spent much time on CB in the last 20 years. When the "skip" is running, you can work the world with 10 watts. If the skip isn't running, you can't work the next state with 5,000 watts. (Unless, of course, the next state is less than 150 miles away).

I'll give you a clue. Amp usage on CB is about two things, either being heard above the next guy, or preventing the next guy from overrunning you. It's nothing more than a competitive spirit gone horribly wrong, and there's no evidence to suggest that this same attitude would not cross over to any other band available to these same undisciplined people.

> A side result of this "culture", has been that these individuals resort to a kind of "entertainment" by jamming smaller-powered stations ("squashing") when the "skip is out".

A "side" result? I'd say that this is probably 50% of the activity on CB during any given day. Just listen to Channel 6.

>
> However, on VHF/UHF frequencies, greater than Line of Sight(LOS) propagation is a fairly rare occurrance - so there is no initial motivation for an average individual to run a high-powered amplifier on these frequencies.

Sure there is. The attitude of being the big dog on the block is still as strong on 154 Mhz, as it is on 27.

>
> The fact that there has never been any direct proof of individuals running amplifiers on these frquencies, seems to be of no consequence to the professors of this urban legend. They will come up with all kinds of contorted reasons why "The end is near", and "widespread amplifier use on these frequencies is just a matter of time". Of course, these are the same arguments these individuals have been making for YEARS, and still - as there are no alligators in the sewers, there are no high-powered amplifiers on GMRS/FRS/MURS.

One other thing is needed for this to happen; popularity. And then there has to be someone willing to market these accessories to the people that want them. FRS has deliberately been manufactured and marketed to discourage amp usage, or modifications in general. MURS is still a service in its infancy. It hasn't really caught on yet with the yahoo crowd. As long as there is activity on 11 meter CB, what is the incentive to move to MURS?

As long as these VHF/UHF services are marketed as short range, mostly handheld units, there will be little incentive for the "big guns" to set up shop. But give it time. Start offering fancy radios, cheaply, with lots of knobs and gadgets, and billy bob will be on those bands eventually.

stewart wrote:
>
> The latest MURS rules changes now simply limit transmitter power
> output to 2W, and remove the old 2W ERP restriction:

Well, if you think about it, it just makes sense to do it that way. You are creating a service for non-technical people (as evidenced by the non-license requirement), and yet expect them to calculate their transmit power plus antenna gain and subtract feedline loss? Add to that that the radio would then need a means to adjust the power until the ERP fell into spec. It was a quagmire to deal with, at ERP levels.

But it does open up a bunch of possibilities, running 2w into stacked 22 element yagi arrays.......

You may want to try Hamscope at http://users.mesatop.com/~ghansen/ for RTTY, ASCII, PSK31, Packet, MFSK16. All you need is your sound card. Best of all it is free.

(Another multimode program is MixW32 but it is $$$ware)

For WEFAX and SSTV, try MMSTV at www.qsl.net/mmhamsoft

Unfortunately, there is no software for Pactor that will work with your soundcard. There is RITTY by K6STI for Pactor/RTTY and a soundcard. It works great on Pactor ARQ but it is my understanding that you need a TRUE Soundblaster ISA card - NO clones. It also works under DOS. Most hams these days want Windows programs. (And fewer and fewer hams are comfortable working with DOS).

The PK-900 works great in Pactor 1 ARQ. It is one of the FEW US modems that have HARDWARE memory ARQ for enhanced performance. The KAM, PK-232 do NOT. I would keep it for Pactor 1 (but it is bulky for a boat).

Pactor II is FANTASTIC but pricey unless you can find a second hand PTC II or PTC IIe.

Rob

I would suggest you acquire a VHF/UHF radio that actually receives
and listen again.

While I'm pretty much a QRP-type operator, I really don't have any argument with anything you are saying. But, all of this stuff really doesn't apply to the services or the discussion at hand. The point is, there have been ZERO actions by the FCC against any individuals/entities for running high-powered amplifiers on the MURS/GMRS/FRS frequencies; and there is(and never has been) the same type of incentive to run these things, like there is on 11m. That's all I'm saying.

What you are failing to see is that rarely do two radio operators operate strict line-of-site. Most, if not all radio communications using VHF and UHF radios are sending a signal to the other radio through vegitation, buildings, cars, people, etc!

Even when I am taking to repeaters on high locations, I have to contend with objects between me and the repeater antenna. Higher power DOES help you to overcome these obsticles.

When I use my FRS radios, I rarely can see the person I am talking to.
DO YOU?

Randy

Nope, they are very useful services... that would be like tearing up
the beginnings of the Interstate Freeway system, because of a few drag
racing gangs (known as the CBers and Freebanders) on Mulholland Drive
in the early 60's.

Quite the contrary - these services are reaching saturation, and need
to be EXPANDED.  Another possibility is to release some of the
pressure on these services by allowing family members and friends to
easily get a ham license by opening up the 1.25M ham band to a New
Novice NoCode Voice Class License.

> now?

For some of the same reasons they get used on 11m. Not that the operator =

wants to work DX, on the contrary they want to be king-of-the-hill. Some =
of these poor folks have such a huge desire to control other people that =
the only way they can find to do it is by "taking control of a local =
frequency or channel", as with CB radio. They maybe the low person at =
work etc., but when empowered by a huge amplifier, that allows them to =
determine who talks and when or they get jammed, gives them the brief =
feeling of being in control - i.e. the Boss. How many times on 11m have =
you heard some channel control freak say " you're not going to talk on =
MY CHANNEL" followed by a dead carrier, loud music etc? Right, too many =
times. In short its an ego trip for some of the idiots, and has nothing =
to do with logic and V/UHF propagation facts. The bigger the amplifier =
all the better to key over other lesser powered stations in their mind.

Billerica is just a fly speck of a town on the map, and about half way =
between Boston and Lowell. I would be more interested in what is =
happening in the likes of Boston for example.

Why bother? All you want to do is spam these newsgroups with your MURS crap.

This is amateur radio, CB radio, or FRS, depending on the newsgroup
cross-posted to, not MURS.

MURS has no purpose. It was an FCC wet dream to clean after a radio
manufacturing mistake - and it will never be more than that.

>In the US on 144.39 is APRS *always* 1200 baud?

Yes.

If the APRS community wants 9600 baud (or any other speed), they'll have to ask their respective regions for another frequency (or take one if there is no oversight organization).

Leleand, lets cut to the chase, if the cop was using his ht as a work radio, he is wrong, period.

> bandm they do it all the time, for various "reasons".

And some of them may in fact be legitimate depending on the Ham. Some do have license privileges to transmit on other than the Ham Bands.

We're not talking about mars or caps here. the thread was typical ham operator, going out of band, using a murs, or up here in the GWN, one of the lpu freqs. Wrong , of couse, bothering anyone, no. BUT it does happen, something I can say I have witnessed. and done the odd time. Why,   hmm, not enough radio's at an weekend event, dial up the handi to the radio's being used, and off we go. Wrong, of course, hurting anyone, no. He're another example, I was working with another ham and we needed radio's, we couldn';t very well use 147.555 for our purpose, being commercial, so we used 151.055, an lpu freq, with no tone to ensure we didn't bother any of the local security guards, et c.

I'm not trying to call you out on this, just make you aware that just becuase hams have thousands of freqs available, doesn't for a minute mean they won't wander. I will conceed that many hams take a dim view of this, but there are plenty that don't.

Sincerely

Dan

In one case I remember seeing a Royal Oak city cop, in full uniform with side arm, sitting at a table in a small restaurant on Woodward Avenue with a very plainly obvious Yeasu HT. His heavy duty Motorola radio was nowhere to be seen. Was he a Ham? I don't know because I didn't ask, and I didn't see him making a transmissions with it while I was there to check for a callsign.

I have seen court officer using the yeasu ht, I think it's a tad easir to
get ear plugs for that the typical Motorola. As long as he's only
monitoring, there no harm being done.

There is no such "novice no-code" class.  Must be another of Stewart's wet dreams.

Here's a bit of a response to all the hams who seem to bash cb'ers with
amps(no I've never owned a linear) Why is it so bad (besides illegal) to
run 100-200 watts on 27mhz, but ok to run 1500 on 28 and 29 ?

The 1.25M band is already open to Novices and to NoCode licensees.

> As long as these VHF/UHF services are marketed as short range, mostly handheld units, there will be little incentive for the "big guns" to set up shop. But give it time. Start offering fancy radios, cheaply, with lots of knobs and gadgets, and billy bob will be on those bands eventually.

I respect all the points you have made. However, because of the fact that we already have had GMRS and FRS for a great number of years(and GMRS does allow external antennas, and does share freqs with FRS, and will allow you to run easily obtainable Part 90 eqpt.), and these types of antics are not going on - I stand by my basic premise that the CB culture is FIRMLY ENTRENCHED and QUITE HAPPY on 11m... these 'ol boys can't just "reach out and knowingly squash somebody" for an extended period of time over in the next county - now matter how many WATTS they pump out. Oh sure, they could squash the conversation of little Billy or Susie on FRS for about 30 seconds, while they were passing thru town, or interfere with a business inventory being taken on MURS for a minute or so - but that is NOTHING compared with the HOURS OF PURE ENJOYMENT these CLOWNS can get on CB.

Sorry Scott. I snipped out your response to this dope, but forgot to
snip out the article attribution which contaned your email address.
Got my dopes mixed up. Easy to do in rrcb.

Apologies,

-A

Oh, COME ON, these people are also running high gain antennas on bands not INFESTED with the level of noise present on 11m. With the type of antennas these 'ol boys typically run, they need the watts to be heard thru all the noise, and to overcome the ineffeciencies in their antenna systems, and to communicate with the other good 'ol boys running a similar power level and antenna system at the other end of the link.

Of course they are going to try to extrapolate their knowlege of 11m to 70cm... but IT DOESN'T WORK - because of LOS limitations, because of the increased imporatance of transmission line loss and antenna gain, and because of the fact that nobody else runs a similarly-powered system, the clowns get NO REASONABLE FEEDBACK, and so they slink back to the 11m slimefest, where they can interfere with conversations of thousands over a five county area, instead of the sheer boredom of only being able to interfere with little Billy or Susie's conversation down the block for a few seconds - who just end up putting on CTCSS, and don't even know that they are being interfered with. There just isn't the same THRILL.

This is why we haven't been seeing this kind of activity on

GMRS/FRS/interstitials. If this high-powered amplifier activity were
REALLY occuring on these services, wouldn't you think the UHF and VHF
amps would be being sold right there alongside all of those HF amps at
the truckstops?

> run 100-200 watts on 27mhz, but ok to run 1500 on 28 and 29 ?

The biggest problem is the sort of "arms race" mentality that has developed. It leads to a kind of "nuclear winter" in which the whole band is so over-saturated with RF energy, that nobody except the ones with the largest amplifiers can cut thru the noise to communicate. Things are ESPECIALLY BAD on the HF bands(like 11m CB), because of skip - as the noise gets propagated ALL OVER THE WORLD!

I would assume the same problem holds true on the HF ham bands to a certain extent. However, hams are taught to use only as much power as necessary to maintain a contact(I don't know how many follow the rule, and how far they will go in interpreting it, but I'm going to assume most follow it to a certain degree - although it isn't the "prime directive" of each and every ham).

Do not send me email wrt newsgroup postings.

I suspect most of your problem arises because you cannot
tell the difference between a post and an email.

Of course not - RF LOS propagation is different than Visual LOS propagation.

Why don't you take a gander at this:

http://www.ictp.trieste.it/~radionet/2000_school/lectures/carlo/linkloss/INDEX.HTM

... pay particular attention to Huygens' Principle, all right?

And while you're at it - why don't you look into upgrading that Technician Class license, Randy?

Now - if you all would stop spreading this high-power GMRS/FRS/MURS amplifier bullshit, I'll stop having to debunk it. Fair enough?

Not a chance.  With 8 zillion FRS units sold and more being
sold every day, outlawing their use would be a joke.

Cheers,
Bill K2UNK

I see no such saturation of FRS. Another family and mine often
travel on weekends and we use FRS between cars. No saturation
encountered at all...much less even another occasional user
on the same channel. This is in the northeast, probably the most
densly populater area of the country.

Cheers,
Bill K2UNK

Stew,
"A great number of years"... Are you sure that
FRS has been around for a great number of years?
How about 1 year (I think).
You know, the way you re-arrange facts to fit the
argument you're making, I think you're a politician.

Are you getting paid by the 'word', or by the pound of fertilizer that you post?

Some people say 5 wpm is equivalent to "no code". If you accept that, then we used to have an "all code" "no-code" license. A license where the only permitted mode used to be CW.

I suspect that the "minimum power needed for the contact" is
observed by hams at the "order of magnitude" level. Can't reach that
interesting DX on 20 with just the 100 watts your transceiver
puts out, well, fire up the kilowatt linear.

There are any number of "opened up" 2M mobile rigs running on MURS. You can find them advertised as "MURS Ready" on EBay any time you like. Just did a search on "MURS" and found 50W Icom IC-2100H available, with prominent mention that it would work on the "new MURS" CB service.

The Class D Citizens Radio Service was never intended for hobby or experimental use. It became that way by default. Because of laziness as a resault of a well-known-inside pizzing contest between certain managers at the FCC - it was easier to just nake thw rules conform to what the outlaws were doing than to enforce them.

The GMRS and the FRS and the MURS were never intendced to be for hobby or experimental usage. But alas, the same throwing-up-of-the-hands that overcame the FCC with the CBRS overcame them for these, too.

FRS was a pet project of Radio Shack to sell lots of junky throw-away radios and MURS was a pet project of EF Johnson to sell more JobComm radios than its competitor could sell Color-Dot radios which both were selling when a Business Radio License was required for their usage. But the outlaws walked into CostCo or Wal-Mart, bought the radios and used them unlawfully and the FCC again changed the rules rather than enforced them.

If you think that these companies had the good intentions of "making communications more accessible for the average person", I have a bridge for sale that may be of interest to you....

Wanna do hobby? Wanna do experimenting? Get a ham license....it's much easier now than when the CBRS and GMRS were first founded.

I agree with Jim. In comparing performance of software, and ease of user interface, the windows software is much more advanced. The Linux software is still at the hacker level of sophistication. It may work, but is so devoid of interface, to be silly.

To label a poster as having "no idea" and then failing to offer even a shred of example software tools, is just this side of hilarious. Are you a Linux soundcard demagogue, or just a rabble-rouser?

Hi,

Maybe because they are very cheap? Here a new 12V 45 AH 'car' battery costs about 24 euros (~22 US$). A 12 V 7AH gel 'alarm' battery costs approx the same. A 12V 35AH gel type is >120 euros (>110 US$). Surely the gel type will be much more adapted to deep cycle conditions, but the price difference more than compensates for it. Of course, car batteries are much heavier, bulky and inconvenient to work with, but, if you have the place to put them, I think they are better.

I do not know the prices of marine / golf / etc batteries, but given

the equation "price = K / popularity" (where K tends to large numbers)
I think they must also be quite expensive.

Toni

I don't know if you really have anything to say, Roger. You didn't even allow the death of your mother in mid-April (published in the Moundsville Echo) to slow your torrent of filth. If you'd like to continue those of your sociopathic rants about me or my wife, I'll be happy to speak with Chief Stenger about you once again (as I cautioned you when we met face-to-face at the March meeting of Marshall County ARES). As you know, he has seen the posts you've made to and about me and my wife in the past and he seemed well aware of you.

quite sincerely,

Dave Heil K8MN

I hear this typical "garbage" from CBers all the time, Hams operating =
out of band. However where are all of those so called "Hams" operating =
out of band, and getting busted? I see far more CBers getting busted for =
freebanding, and running power. In fact several CBers have said they =
even heard me ID on the freeband using my Ham Callsign. Since I never =

operate there it's clear to me that somebody was bootlegging on HF using =
my call. Then to claim same instance as "proof positive" that Hams =
operate out of band, stupidly ID'ing themselves, does not persuade me in =
the least. Any further argument runs into the same problem, just because =
somebody hears a Ham callsign, does not imply it belongs to the person =
using it on the air. So until somebody can provide proof positive the =
accusation is basically BS.

The idea that Hams would limit themselves to 2 watts on five frequencies =
on MURS, compared with up to 1500 watts over 4 MHz on 2m, is so =
ridiculous as to not even be worthy of serious consideration.

I heard it from a Ham.

You'd have a hard time convincing the person who posted about the
situation.

It would seem ridiculous to limit themselves to 2 watts on MURS, they
were running well in excess of 2 watts on MURS.

On with the fox-hunts.

Mike

=========
1) As Roy Llewallen commented in an earlier posting ,a Sealed Lead Acid
(SLA) battery is not necessarily a Gel- type.

2) An SLA 12v-18Ah costs approx US$ 25.- (in the USA)
In the UK ,Mainline Surplus -Leicester sell SLA 12V- 18Ah ,make Kiel (New
Old Stock) for GBP 12.50 incl VAT= Value Added Tax) equiv to approx US $
19.-
I have quite a number of these in the shack and am quite happy with them.

For golfers in the UK : This battery is very suitable for an electric golf trolly. I recently replaced a Yuasa model: NPC15-12 , 12V-15Ah SLA which had been rather active for the past 3 years ,by the above make Kiel battery having identical dimensions . The old Yuasu battery has been retired to the shack where it still performs well be it on loads somewhat lower than a golf trolly motor .

3) The 'cheap' car batteries referred to in the above posting might not be the sealed type .In that case it would not be advisable to have them located in the shack , for safety reasons ....because of hydrogen/oxygen venting. Venting batteries with removable caps for water top-up must be located in a well ventilated area !!

We can thank the broadcast industry who found ways to drop in local or regional AMs where the clear channel "holes" were and the manufacvturers who now make AM broadcast transmitters that are much more reliable and therefore do not need to go off the air on Sunday nights for "maintenance".

>Radio is an appliance to Americans, not as much a hobby anymore.

It's our job as hams to make it a hobby again.

There's a whole WORLD of things you don't know, ASSHOLE. In fact by the
expression on your gorilla-like face, It'd be hard to believe that you know
anything.
Funny, the First amendment allows me to have the opinion that you are a
narrow-minded, stupid son of a bitch. See you engage in the very same
tactics you say I use with Jim here.

For instance, did you get touch with Carl Stevenson's local police, too?

Dave,

I have never denied you any rights. I have only said I think
you're a stupid, ignorant, facist, asshole.   You have every
right to your opinions and to voice them no matter how disgusting
they may be. I hope my postion is perfectly clear.

Learn to use a killfile on my posts, dumbass.

> You [whining]

Yet you don't allow anything to try to stop you from censoring others. You can fucking say whatever the fuck you want, but you seem to want to censor others.

So just fuck off, you slobbering dullard. You have a history of causing trouble with people you disagree with as well, and I have some of those posts archived like the above one. Now you're stalking me? Bwhahahahahaha!!!!!!

> If you'd like to continue those of your sociopathic rants about me or my
wife,

I can have opinions, Heil, you fucking asshole. And my opinion of you is that you are a fucking retard. Use a fucking post filer/killfile or just fuck off.

>I'll be happy to speak with Chief Stenger about you once again (as I
cautioned
> you when we met face-to-face at the March meeting of Marshall County
> ARES).

Stalker boy, you go right ahead. I still have the freedom of speech, you neo-nazi asshole. I have evidence that the only reason you went to the ARES meeting is to try to stalk me, too, ASSHOLE. And it didn't work, you made yourself out to be a desperate whining ass, former government errand boy. And after the inquiry why the police is harassing me (and your harassment) will look funny down at the Prosecutor's Office.

> As you know, he has seen the posts you've made to and about me
> and my wife in the past and he seemed well aware of you.

But he hasn't seen you threats made to me by e-mail yet, but he will, ASSHOLE.

> quite sincerely,
>
> Dave Heil K8MN

Fuck off. Learn to killfile me or just shut the fuck up.

I'm using a rigblaster with a Toshiba laptop feeding an Icom 756 Pro II. Using Digipan, everything works fine on PSK31. I am looking for something with more versatility to copy AMTOR/RTTY, etc. I looked at UA9OSV's "trutty" program, but that does not key my rig even though digipan does (so the rigblaster is hooked up properly).

Anyone have any suggestions? Would like to stay away from PK232, and just focus on soundcard, and rigblaster.

Thanks all

Bob/WF3H

"This difference between liberalism and conservatism
must not be obscured by the fact that in the United
States it is still possible to defend individual
liberty by defending long-established institutions.
To the liberal they are valuable not mainly because
they are long established or because they are
American but because they correspond to the
ideals which he cherishes."

F. A. Hayek in "Why I am not a Conservative"

I dunno, Paul. The thread started about how great MURS is. How is MURS more relevent than amateur radio? As far as your per-captia stats, you might have a point. U.S. colleges are graduating more and more foreign engineers and doctors than ever. You may have a valid point. I wouldn't be surprised to find the U.S. an also-ran 3rd world country in another 25 or 30 years. Everyone wants an MBA. Read Dilbert. It is one comic strip worth reading. Don't worry - Japan will design and build all the FRS, cell phones, stereos, and televisions you want. (oops, make that design. I forgot. The little dragon is building the stuff now - at least the stuff that China isn't.)

73 from Rochester, NY

Take a look at MixW2 - it does a number of modes including RTTY and it can control your PRO-II frequency and filter settings. MixW2 will receive Amtor and transmit Amtor FEC and can receive Pactor. To my knowledge there are no Windows based sound card programs that will transmit Amtor or Pactor ARQ modes (there is a DOS program around that will work with a true sound blaster sound card only).

I have recently upgraded my laptop and have a very nice Dell Latitude CPx to trade for a Japan Radio NRD-535D.

This laptop has a P-III 500MHz CPU, 192MB of RAM, an 11.2GB harddrive, CDRom, Floppy with external connector cable, Ethernet PCMCIA Card, 56Kb PCMCIA Modem card, 13.5" Color TFT Active Matrix Display, Dell Laptop case and two high capacity batteries (both of which are brand new). It comes with Microsoft Windows 2000 Professional w/SP2 installed, but an original Dell Win2KPro w/SP1 CD.

Will trade even for a JRC NRD-535D HF receiver in good cosmetic and working condition. Must have a serial number above 56000 and the original 535D features installed.

73s,

Chuck Yarbrough
Durham, NC

Well I have seen hams use out of band freqs, 151.055, 451.1875.... not just heard, but seen. Don't for a minute think that hams don't go out of bandm they do it all the time, for various "reasons". Threy don;t get busted, cuz they don;'t cause interference, they run open pl, and aren't running dirty amps.

I hear this typical "garbage" from CBers all the time, Hams operating out of band. However where are all of those so called "Hams" operating out of band, and getting busted? I see far more CBers getting busted for freebanding, and running power. In fact several CBers have said they even heard me ID on the freeband using my Ham Callsign. Since I never operate there it's clear to me that somebody was bootlegging on HF using my call. Then to claim same instance as "proof positive" that Hams operate out of band, stupidly ID'ing themselves, does not persuade me in the least. Any further argument runs into the same problem, just because somebody hears a Ham callsign, does not imply it belongs to the person using it on the air. So until somebody can provide proof positive the accusation is basically BS.

The idea that Hams would limit themselves to 2 watts on five frequencies on MURS, compared with up to 1500 watts over 4 MHz on 2m, is so ridiculous as to not even be worthy of serious consideration.

True.

> batteries I've seen, with the exception of cylindrical Gates cells, have
> liquid electrolyte. Sealed lead-acid batteries with gelled electrolyte
> do exist, but they're relatively rare. So without other information, I'd

Not at all rare.

The typical "maintenance free" lead acid is not sealed and will spill in some positions, and they do vent under hard charging.

The true sealed lead-acid can be operated in any position (will not leak) and does not vent unless severely abused (venting is a last chance method to avoid a case rupture, similar to nicd/nimh).

I have only seen two technology types of sealed lead-acids. The gelled electrolyte type is by far the most common. The other is the starved electrolyte, typified by the Absorbed Glass Mat (AGM) batteries like the Optima yellow or red top or the exide "6 pack".

The gelled cells are a fraction of the price of AGM cells. They are found in alarm equipment, "portable jump start" power packs, children's rechargable riding toys, emergency lighting, rechargable lawn and garden equipment, consumer computer UPS systems, etc. In other words, nearly everyplace which needs higher capacity than a small nicd pack, and where the weight of lead-acid is tolerable.

The typical yeasu 12v/7ah/$20 "brick" is a gelled electrolyte, and probably the single most common sealed lead acid battery in the US.

> assume that the Mendelsons "gel cells" have liquid electrolyte, not
> gelled.

I wouldn't. But $16 is a very good price for new 12v/17ah gelled...

As usual, I've got a lot to learn. What I've seen overwhelmingly at flea markets, electronics stores, and places like EH Yost are Panasonic SLA batteries. These are of the absorbed electrolyte type, in which the liquid electrolyte is absorbed into the plates and separators. http://www.panasonic.com/industrial/battery/oem/images/pdf/slaover.pdf discribes these units. In second place for the number of batteries I've seen for sale are the small Yuasa SLA batteries. I couldn't find a description of the electrolyte system in a quick search of the web, but an old data sheet I have describes the system as "suspended electrolyte". I've assumed that these are also AGM type, but perhaps I'm wrong.

I couldn't find any reference to Yaesu batteries. Perhaps you mean Yuasa. But I couldn't find a 17 Ah battery among their offerings. Do you have the part number of this apparently very common battery? I'd like to look at a data sheet to learn more about it.

Well now that got all your battery gurus on deck, what type of
battery does my APC backup unit use. I suspect GELCELL but not
sure. How long do these hold up under very light use.
I backup my "RAMLINK" with one APC and the current drain
is less than .5 amp. It stays on 24/7. When first bought it
power outages of 5 or 6 hours didnt bother it at all. Lately
(this past year) is seems to loose the system more often for
no obvious reason. Does this type battery have to be replaced
often with such light useage??
Joe (aka kilroy)

Ah. That explains the low price. :(

> So new, means NOS, but with SLA batteries, if you don't charge them once in a while,
> they lose much of their capacity.

If sitting for four years, I'd expect them to be almost but not
quite useless because of extreme sulfation. A couple more years of
sitting and that would be the end of them. A year or two ago I
purchased a UPS "new in box" which had been sitting since 1994. It
contained four, 6v/4ah gell cells. Of those four batts, three of
them would not charge above a fraction of a volt. the fourth
charges to about 2.1v, with nearly 0Ah capacity.

I sure hope the Mendelson batts are better...

Of course you may be able to recover the sulfated batts, but I'm
skeptical. http://www.shaka.com/~kalepa/desulf.htm

ROTFL!! then why am I running soundmodem to decode packet, qsstv
for sstv on HF, watching DVD's with xine, listening to IRLP reflector
2 with Realplayer, using xmms to listen to local fire+emerg streams,
using aumix to set all my stuff on my Live!Drive, watching TV with

```
Xawtv, cutting VCD's with gcombust, playing UnrealTournament, Quake3,
frozen bubble, descent freespace, using spare hard drive as a P.V.R.,
all within Linux Mandrake 8.2?
     If ignorance is bliss, you must be very, very, very, very happy indeed!
Cheers all,
JJ

Yeah, if you have trouble with sound cards, you either have a weird card -- like an Mwave/Monster Sound or something, or you haven't tried Linux recently. For the most part, sound support in Linux is not that bad.

What sucks for Linux are winmodems, winprinters and a lot of the webcams. A lot of this stuff won't work under XP either, it seems.

Me, I avoid the weird printers and modems and stuff. But, I have found the webcam limitations a little annoying -- since a webcam is exactly the kind of thing I'd like to run on a server.

The commands I use are...

```
sndconfig
```

which probes for the sound card and sets it up.

And

```
aumix
```

For setting the mixer values.

I use Linux Sound to run my live police scanner on the internet.

```

Are you talking about general multimedia or digital modes?
I don't think the general media situation on linux is any
different to Windows; XMMS and similar programs offer almost
an identical interface to Winamp.

Digital modes - well, there's less to choose from, but there's
still PSK31, MFSK, and RTTY, all with quite decent interfaces.
Packet isn't much harder to setup than the AGWPE, which isn't
particularly easy IMHO.

> To label a poster as having "no idea" and then failing to

I thought Jim's posting was so devoid of facts that I
didn't think it was worth the effort.

Hi Bob,
I am using MixW   It is shareware but you can use it to see if you like it.
It has 17 modes to use, like psk, amtor, packet,etc. I used 3 other
programs before I found MixW.   Do a search on Google for MixW. The latest

version is 2.06 I think you will like it. Works great for me, evan on the
builtin sound card. Good Luck,

Bert   N7TKO   Gold Bar, WA

Hi Bob,

Did not see this before.    Scroll down about 20 messages to Jim Jaffe's
(MixW 2.06) message. It will take you to the site. Jim is the head man.
.   Also down 15 messages is another one from Jim worth reading about things
coming.

I've been using them for nearly 15 years here and no problems. Car batteries hold up fine as long as you don't overcharge them, don't let them discharge too far, and keep the water up in them. But I do prefer a marine deep cycle if I had my choice as their design suits radio use better. But a car battery will work just fine. I'm running a 706 on one right now. I use a fully automatic charger to keep the charge up, but a trickle charge will work fine as long as you remember to unhook it when you have a full charge. Heavily discharging a car battery will greatly shorten it's life and capacity. All long as you avoid that, you won't have much trouble. A deep cycle can handle heavy discharges better, but even with those it's best not to heavily discharge them. I never heavily discharge any of those lead acid batteries on purpose. Sometimes it'll happen though out portable etc. If I buy a new battery just for radio use, I get the big marine deep cycles. MK

Like any of the classic urban legands - LSD tattoos, Kidney theft, Alligators in the sewers - the GMRS/FRS/MURS high-power amplifier myth just keeps making the rounds...

http://www.urbanlegends.com/

The myth - spread by hams having a strong "radio cop" slant - has absolutely no basis in fact. The motivation for spreading the rumor is somewhat complex - but, the main motivation appears be to maintain some kind of "superiority complex" these hams harbor over "CB users". A secondary motivation seems to be to stop the growth of these wildly-popular radio services - as ham VHF/UHF usage has continued to decline in recent years, these services are rapidly growing in popularity.

There has never been a reported violation involving amplifiers on any of these VHF/UHF frequencies; and, the fact is, there is simply no real motivation for the average person to use amplifiers on these frequencies.

THE BASIS FOR THE LEGEND:

Illegal amplifier use on 11m CB frequencies has been an ongoing problem for many years. However, the dynamics of radio wave propagation on HF CB vs. VHF MURS or UHF FRS/GMRS are quite different. Sky wave, or "skip" propagation is commonplace on HF frequencies. To take advantage of this propagation requires running more than the legally-allowed 4W output allowed on 11m CB... as a result, many truckers(and other citizens) have resorted to using illegal amplifiers to raise the output of their radio stations to outrageosly-high values; 500, 1000, 1500, even 2000 Watt amplifier use is commonplace - allowing these individuals to communicate great distances(sometimes 1,000s of miles when the "skip is in"). A side result of this "culture", has been that these individuals resort to a kind of "entertainment" by jamming smaller-powered stations ("squashing") when the "skip is out".

However, on VHF/UHF frequencies, greater than Line of Sight(LOS) propagation is a fairly rare occurrance - so there is no initial motivation for an average individual to run a high-powered amplifier on these frequencies.

The fact that there has never been any direct proof of individuals running amplifiers on these frquencies, seems to be of no consequence to the professors of this urban legend. They will come up with all kinds of contorted reasons why "The end is near", and "widespread amplifier use on these frequencies is just a matter of time". Of course, these are the same arguments these individuals have been making for YEARS, and still - as there are no alligators in the sewers, there are no high-powered amplifiers on GMRS/FRS/MURS.

So you're saying that doing 100 watts on VHF isn't going to help much over 2
watts?  What pipe are you smoking?

I've been monitoring all 5 MURS frequencies for some time now mobile. =
All I have ever heard is the typical business junk and fast food drive =
through order windows with just one single exception. I hear low power =
1.2KBS FSK packet activity on 151.880 MHz around the Square Lake and =
Interstate 75 junction in the city of Troy Michigain. Once you get more =
that a mile or two from that area the signal drops from a S9+20 to =
almost nothing. A high power signal this is not. And this is in a metro =
area of several million people with a good percentage of active Hams. So =
if what you say is true then I should have picked up more that one lousy =
low power packet station in the last year I have been monitoring, =
particulary given the size of the Detroit area.

amps on
> VHF/UHF - it is VIRTUALLY USELESS.

It is not "VIRTUALLY USELESS". For operating well beyond the LOS for two =
stations it would be true most of the time. However for two stations =
within LOS of each other it is not. One of the factors is the about of =
ground clutter between them, and how much of the RF power is either =
reflected off in to space or absorbed. The only other way to beat path =
loss, while using the same rigs, other than antenna gain, is to boost TX =
power, thus the market for V/UHF amplifiers. Think about it the next =
time your cell phone will not connect while inside of the big department =
store or a customer's factory location etc.

 It appears you may need a little Education on VHF and UHF Propagation. Its apparent thatyou have no Idea what you are talking about.

I have a Johnson "Challenger Plus 242 7166", a VHF business band mobile, that I got from a ham friend who owns a radio shop. To make a long story short, he programmed the radio, dropping the VFO for use on 2 meters. I've since moved, and am looking for schematics for a programming cable and also programming software for this rig, as I'd like to use it in the shack for packet.

If anyone has any info on this thing, please post here and/or e-mail me directly. Any help appreciated!
73,
Doug, K4EK

And why would the Prosecutor want to talk to you, Roger? To tell you what a
stand-up citizen you are? NOT!
And why would you contact the ACLU? Of course you didn't. You are lying
again.
Keep it up, Rog. Maybe you and AMP have more in common than was originally
thought.

Good grief, Stewart. One begins to wonder exactly what you are trying to promote. I've run phone patches from Guam to Webster, NY, running only 15 watts! I've gotten into a cw net thousands of miles away - running MILLIWATTS. Power is needed in VHF/UHF for some of the more exotic modes. Meteor trails, moonbounce, some scatter work ... heck, with my 6 double a alkalines, I can open repeaters close to 100 miles away (well, one that is high - and that is when I'm up on the 23rd floor of an apartment complex, but you get the idea). Problems happen when unknowlegable folks apply the golden screwdriver. I've seen posts which state you only have to turn a pot to make your FRS radio 'louder'. I doubt going into deviation and descriminators would help as it is likely over that user's head. Believe me, I've had a lot of fun back in the early 70s with CB. The urban legends usually circulate amongst those who don't know enough technology to know when something is simply not true. I saw a post perhaps not a week ago on a board from someone looking for a mod for a radio. Another guy posted a link to a website with the mod. Sure enough, TWO DAYS LATER, the first guy posts again with the subject 'HELP'. Seems he let the smoke out of the components. Seems the radio is stuck on 28.500, won't transmit, and squeals when the audio gain is turned up. You seem to think the amateurs are putting people down. The problem is that some folks are being led into things that they know nothing about - and it shows when some 27 MHz signals are 50 KHz wide. Unless you are working moonbounce, a 3 dB signal gain or loss won't usually amount to anything - yet people mod their rigs to try and get that 3 dB extra, which is usually spread where they don't want it. My guess is that the majority of amateurs are running 150 watts or less. The large majority. And working stations worldwide every day. Why do you think one necessarily needs a linear? Sure, the big gun DXCC guys run 'em (often with a mentality that is similar to yours), but most don't honestly need 'em. Besides, going from a ground mounted vertical to a 3 element beam up 60 feet will often gain you as much or more than increasing from 100 to 1000 watts and cost less.

73 from Rochester, NY

I know the fellow. He wasn't jerking anyone's chain. He was a bit upset by their arrogance, not really caring if anyone found out who they were.

>So if what you say is true then I should have picked up more that

Sure, if VHF had skip. I have not heard any high powered MURS stations anywhere between Everett and Seattle WA.

If you'd like to chat with your high powered buddies on MURS you might take a little trip to Billerica, MA. Sounds like it would be an easy fox hunt, well, more like an elephant hunt.

Mike

Isn't it just TERRIBLE! People are starting to communicate all OVER the place. We can't have THAT now, can we? Better start a rumour on the Internet, right away! We need to get this evil GMRS/FRS thing BANNED!!

NOW - THE REAL REASON FOR THESE SMOKESCREENS:

Having failed in their attempts to assert the URBAN MYTH that high-powered AMPS are being used on MURS/GMRS/FRS, these ham "Internet Lobbyists" are now trying this NEW TACTIC to divert attention from the fact that the ham VHF/UHF bands are VIRTUALLY UNUSED - and that FRS/GMRS/MURS are runaway success stories in public communications.

PSSSTTT!!! Don't look now - but the ham 1.25M band has FALLEN SILENT... go ahead, scan it for activity sometime - THERE ISN'T ANY! ... and sales of radios for the 222Mhz band have all but dried up.

... what to do? WHAT TO DO?! Let's start another rumour - there are CHILD MOLESTERS on FRS!! That's it! We need to BAN FRS, because the Catholic Priest Radio Club has infiltrated FRS with GMRS bubble-pack radios!

Stewart - N0MHS

Not that difficult....  The average termite can justly feel superior
over a cb-er.   :-)

Just like the CW code speed reduction idea, eh?

As I recall, you LOST that one BIG TIME... and you'll LOSE this one eventually, too.

Yes - eventually the ARRL and the FCC will see the obvious - it is only a matter of time. You can try to slow down progress - but EVENTUALLY it will catch up to you and pass you by.

Tell me - why do you do it? Why do you fight progress? Go back and think about all the arguments you made fighting the code speed reduction - they are the same ones you'll make against opening up 1.25M to a new Novice Class. It's been quite a long time now since restructuring, and NONE of the bad and evil things you predicted have come true. Why are you so NEGATIVE? Don't you have ANY faith in your fellow Americans?

I think it depends on which lobbyist carries the most cash. A harsh
accusation to be sure, but many of the Commission's decisions in the
past few years are inconsistent with any other method of management.

17AH gel cells will barely run an HT. High current drains are
impractical because gassing within the cells insulates the plates
faster than the gel can absorb and causes the internal resistance to
rise out of hand. Current drains should be limited to 20% of AH
rating (and with boat batteries too).

Big as you can get (into your tray) Marine/Starting batteries are a
pretty good compromise if you have to use it in your car.

Are you kidding me? I've put out some WHOPPERS over the years on rrap. See below for an example of one: "synthetic ionization of the ionosphere".

But, I do think that the VHF/UHF ham frequencies are being wasted, and we need to reinvoke NOVICE class as a no-code VHF/UHF only license... or, simply expand services like FRS and MURS. 11m CB is a red-herring and has virtually nothing to do with VHF/UHF.

****
Tech advances force FCC to consider Ham HF freq auction:

WASHINGTON (AP) - Spurred by the many recent advancements in the Laser ionization technology field, the ITI Corporation (Ionization Technologies, Inc. - Fairfax, VA) has proven that it is now economically feasible to synthetically ionize specific areas of the ionosphere, opening up new many new reliable and low-cost telecommunications applications.

The best frequencies for utilizing this technology lie in the HF portion of the electromagnetic spectrum. While the HF portion of the frequency spectrum has long since been allocated to specific purposes; there are many HF frequencies which could be re-allocated to better serve the nation. The Federal Communication Commission(FCC) is considering re-allocating at least half of the Amateur Radio Service's current HF frequency spectrum to the newly proposed ISS(Ionization Skip Service), where it can better serve the public's telecommunications needs.

Stewart Robertson, President of ITI, says; "The older naturally-induced HF skip communication techniques essentially waste 99.9% of the HF bandwidth, and communications are generally of very poor quality, very unreliable, and

end up causing wide-spread interference. Using the new synthetic ionization
techniques, we can specifically direct RF energy over great distances,
wherever we want it, anytime we want it. Communications are no longer
predicated on solar activity - we can now directly and safely control
ionization evels in specific areas of the ionosphere, opening up all kinds
of new possibilites in reliable long-range communications applications."

Does anybody know first hand if truckers are presently or going to use MURS or FRS?

Are you CB/Hamster dealers persuing this avenue and presenting it to truckers?

If there's more than just a handfull of same company truckers using it, I would also use it.

Personally, I've always liked the idea of a few fm channels in the VHF/UHF regions just for truckers.

If there's a migration to MURS by truckers in general, it will be to escape the present CH19 blatherings of hi power idiots and base stations whose sole function in life is to cause interference just for the sake of it. I agree that if it becomes more than a fad, the MURS ch.'s will most likely end up sounding like the present CB 19 but it should be a long while before that happens.

Maybe you are not familiar with the mentality of these idiots. Regarding amps, the most important thing is "swang", referring to needle movement. They start by modifying their radios. The modulation limiter is disabled so they can sound "louder", irrespective of splatter and harmonics. Then they run the output to a Class C driver with the intention of re-modulating the carrier just to get the peak power higher. Then it gets sent to the final amp, which is usually just a box filled with push-pull power transistors and wired in parallel. These amps are not designed for linearity, but for raw power. They are not intended for communication, but for "stepping power". Have you ever attended a "keydown"? It is a contest to see which amp is louder, and intelligibility of the audio is almost irrelevant: Two mobiles are set up on a line, they rev the motors and key away at the same time. The winner is the one that is heard above the other. Forget ERP or linearity, it's nothing more than an RF drag race.

Now we all know that ground-wave propogation on 11m sucks almost as bad as VHF and skip is very inconsistent, which is probably why the hams abandoned it years ago. Just like VHF, 11m has a limit as to how much power is practical, yet amps in excess or 1000 watts are commonly used by IOs.

Not only that, but there is a lot of money to be made by making and selling illegal radio equipment. They already know that some people will be violating the laws on the band, so all they need to do is convince them that what they need is a bigger amp. That's not hard to do, even if a bigger amp provides no practial benefit whatsoever, because they will tap the competitive nature of people: "My amp is bigger than YOUR amp!" It works. Just look at how many illegal amps are for sale on the net.

The point is that they don't care about any sort of practical communication, they are only interested in doing whatever gets their rocks off, to the detriment of anyone else using the band, and they will do so while laughing in the face of the US Government. Unless the FCC decides to police the bands, the same thing will happen on MURS and FRS, because that's the way people are.

Hardly. It's used quite a bit in just about every metro area I have
traveled through. Have you tried hooking up your antenna?

I've found that, for reasons that I don't understand, amateurs call all sealed lead-acid batteries "gel cells". All the sealed lead-acid batteries I've seen, with the exception of cylindrical Gates cells, have liquid electrolyte. Sealed lead-acid batteries with gelled electrolyte do exist, but they're relatively rare. So without other information, I'd assume that the Mendelsons "gel cells" have liquid electrolyte, not gelled.

Roy Lewallen, W7EL

JB wrote:
>
> 17AH gel cells will barely run an HT. High current drains are impractical because gassing within the cells insulates the plates faster than the gel can absorb and causes the internal resistance to rise out of hand. Current drains should be limited to 20% of AH rating (and with boat batteries too).

Hans. That is what 11 Mtr. CB was allegedly designed to do many years ago.
As goes the 11 Mtr. bands, so also will go the MURS frequencies.

I agree with a lot of what you are saying. I just don't think the amplifier issue can be extended to MURS/FRS/GMRS - the fact is, we just aren't seeing it happening.

If I see this kind of nonsense on MURS, I'll DF the fool, and turn 'em in.

Now, I'll have to admit, I live in San Diego, and what I have seen are some Mexicans running over-amplified setups on 154.600, but I'm not going to go down to Mexico with DF-equipment - the TJ cops would just end up busting me down there.

Stewart - N0MHS

  Not here - 2m is highly used both for voice and for data (packet)
  and 440 MHz is not far behind.

  The metro area is not one of the country's mega-centers but we do
  have lots of active hams.

The FRS freqs in our area are not overly busy, but what is heard on them is
a precursor of what is to come. Cussing, arguing, name-calling, et al are
already happening. It will only grow worse and MURS will soon follow suit.
To believe otherwise is foolish and myopic.

I wonder how long it will be before we hear "Roger Beeps" and echo boxes on
MURS?

It's been around for quite a long time(1996?) - pretty much EVERYONE has one
of these little radios now - there aren't folks with amplifiers abusing
these frequencies. If it hasn't happened by now - it NEVER is gonna happen.

The argument was that people would use AMPLIFIERS on FRS and MURS - this is absolutely wrong... you KNOW IT, and are trying to CHANGE THE SUBJECT.

Amplifiers are not being used on FRS, GMRS or MURS.

Stewart - N0MHS

Tell me why 'Joe Average' would even think about setting up a repeater, or cross banding VHF/UHF. Seems like a very silly idea to me. Would that repeater system be private, or public for a fee perhaps?

MURS could fill a need, but please don't tout it as a viable replacement for amateur radio, it isn't and will never be such.

'Doc

PS - Posting to multiple groups is as moronic as the other idea.

stewart,
    2 meters is dormant, unused? What part of the
country do you live in? 'Dormant' and 'unused' are
not exactly how I would describe 2 meters in this
area. Stew, ol'buddy, I think you'd better have your
receiver checked...
                    'Doc

Only given to us because nobody else wants it - at the moment.

As soon as somebody comes up with a way to make money out of some or
all of those frequencies, we'll lose them.

Profit first and above all else. Guys.....   Remember?

Nick.

It seems, that Skysweeper 2.8 (www.skysweep.com) is the only software in the
market supporting both ACARS and HFDL modes.
Before buying it, I would like to test also other softwares supporting both
those modes. Any suggestions?

-Tapio

No matter what you post, no matter your arguments, the simple unalterable
fact remains that the low life
CBers will soon ruin the MURS frequencies. Common sense and reality will ,
despite the claims of the self-professed intelligentia, eventually rule.
I tend to scoff at those who claim to hold themselves aloof from us
commoners. These self-proclaimed phonies most usually live in a fantasy
world bordered by fantasy and Harry Potter books.
You Muggles are all the same.

Too bad it does not do HF Packet like MixW and MixW is a much easier package
to use. Skysweeper is very difficult to use. Be careful what you get into.
Is HFDL worth it?

>The argument was that people would use AMPLIFIERS on FRS and MURS - this is
>absolutely wrong... you KNOW IT,

I have For Sale 6 GE Delta S, 32   Channels, 110 Watts, FM, easily programend
for any Freq from 144 to 160 Mhz. There is no need for Amplifiers when the
Radio can already put out 110 Watts.
 Now do you see how easy it can be to turn MURS into a High Power CB like 11
Meters?

"stewart" <horseshoe7@yahoo.com> wrote

> But, in any event, I'm basically comparing MURS to Amateur Technician

Not even close to being comparable. Amateur Technician has incredible advantages over MURS. (By the way, there is no Technician license limited to just 2M, so don't try to drag out that red-herring.)

MURS -- 5 specific frequencies, less than 100 Kilohertz of total bandwidth.
Tech -- Millions of frequencies 23,962,000 Kilohertz of total bandwidth.
Advantage Tech 239,620-to-1

MURS -- One band
Tech -- Seventeen bands
Advantage Tech 17-to-1

MURS -- 2W output
Tech -- 1500W output
Advantage Tech 750-to-1

MURS -- Antenna height 20'

Tech -- No antenna height restriction.
Advantage -- Tech

MURS -- FCC certificated radios only. Modifications illegal.
Tech -- Free to use any purchased, homebrewed, or modified radio without FCC certification.
Advantage -- Tech

MURS -- Operation restricted by US borders.
Tech -- Reciprocal operating agreements with nations all around the globe.
Advantage -- Tech

I could go on and on, but I'm sure you're getting the picture!

Comparing MURS to even the lowest privileged Amateur Radio license is like comparing a tricycle to a Lamborghini, and the comparison suffers even worse when you compare MURS to a General or Extra class Amateur Radio license.

I love it when you talk LOUD to try to overcome your lack of rational
persuasion.

Speaking of loud, in the case of MURS (with only 5 channels) the old notion
of 'capture effect' will ensure that I can get through all the other weak
signals on channel.  'Capture effect' is done with power.

Can you say "amplifier"?

I knew you could!

Wait until a couple of good ol' boys get frustrated with the congestion on
those measly 5 little channels, and discover the magic of 'capture effect'
on FM.

Can you say 'afterburner'?

I knew you could!

I've got a whiz-bang dual bander in my car with enough memory slots to plug in -every- 2m frequency pair and simplex frequencies. And they are programmed in. Then I have a handheld scanner with the same frequencies programmed in. At home I have another scanner with the "popular" repeater and simplex frequencies programmed in.

With all that said, there is very little 2M FM activity in the central Ohio area. Compared to Omaha NE is the mid-late 80's, its dead.

Don't even bother!!
I WAS at Dayton, and those "new" batteries had not been charged for 4 YEARS(at least
that was what I was told by a Mendelson employee).
So new, means NOS, but with SLA batteries, if you don't charge them once in a while,
they lose much of their capacity.

If both users don't mind wandering around with 11 element yagis
nailed to their hats, and *if* they don't mind having to keep them
continuously pointed at each other while moving, then they might be
able to match the performace of a good 2m mobile rig.

Some of us like to talk more than a few miles away.

Relevance???? I have a ham license, I am working on a 2.4ghz antenna, and a 160m antenna. I will look at and try if possible any new technology on one end and restore/use BA gear on the other. I love telecommunications. My ham ticket is relevant to me because I am an experimenter and an operator. I use 802.11b for home networking, just another technology. MURS is interesting. Do I see it as a threat to HR? No....Cynics who want to prophesize the demise of HR are the real threat. Do something, contribute to the science of radio, teach others.

If the AR service is irrelevant to you......quit.

Like Bob Dole, as he exited public life, sponsored a bill allowing 100% of
the radio/tv media in any metropolitan area to be owned by one person.

Why would he do that?

Horseshoe, you're going to have to help us here.

We need you to explain the difference between useful ERP and "virtually useless' ERP.

On one hand you say higher ERP is VIRTUALLY USELESS ---

> So please, do try to feed me a bunch of happy horsecrap about using amps
> on
> VHF/UHF - it is VIRTUALLY USELESS.

But on another hand you applaud the lifting of ERP limits ---

> This effectively raises the ERP limit to about 10W for omni base
> stations, and about 50W with a directional beam antenna.

Which kind of ERP is useful?

I can imagine ol' Billy Bob buying hisself a 14dB gain antenna, string some lowloss coax, and exclaiming "Sheeeett, ah'm putting me an ERP of 50W over toward ol' Ellie Mae's house!."

Then I can imagine Ellie Mae hollerin' back "Yeah, but I called 1-800-HAM-AMPS and got me one of them thar Mirage B-320G bricks, and ah'm puttin' me an ERP of 200W in every durn direction! That be making me about 6dB louder'n ya'll in every
direction!"

Well, ol' Billy Bob's mammy din't raise no idjits. He slaps hisself on the forehaid and esclaims "Ah'll jess get me one of them thar bricks too -- lessee, my antenna done gave me 14dB, and that thar brick of Ellie Mae's is givin' 20dB -- that be 'bout 34dB -- holy sheeeeeeeitt, my ERP done be 'bout 5,000W -- hell's bell's -- I ***OWN*** them thar MURS channels fer a hunnert miles around old Mount Baldy!"

Stewart, you seem to think there isn't a point. The point is about learning. This served the United States very well back in 1968 (I believe it was 1968 - within a year). The Coast Guard lost a big tower on Saipan (did I get this right this time, Hans?). The Navy was having a big problem copying the hams they sent over to get communications back up (the disaster was caused by a typhoon). I was in the shack at KG6AAY on NavCommSta Guam and heard the goings on. I called the signs 'sparkplug, sparkplug1, this is KG6AAY standing by'. The net result was that the AMATEUR RADIO OPERATORS restored communications. For a number of days, we were the ONLY communications to that island. Hans was one of the guys that went over to Saipan. This has happened countless times, you simply may not have heard about it. One does not learn simply by talking on the radio. The hobby is much richer than you can ever imagine (and far bigger than I know about as well). It is a valuable resource to this country whether you or I believe it or not.

73 from Rochester, NY

In that case, please email me and I will provide the shipping address
where you can send all of your ham equipment. Thank you!

Let me refresh your memory. The discussion was about noise caused from skip, to which you responded:

"...not all DX is reciprocal inkind or magnitude."

Now what does that mean if not saying that the -reciprocity- of skip is a factor in band noise? I'm sure most will agree that skip causes noise, but how does one-way skip affect the noise level differently than two-way skip? That's what you said, Randy, like it or not. Now quit avoiding the question and answer it.

I guess he thinks one-way skip creates only half as much noise as
two-way skip.

It means what it says Aaron/Sparky. How fucking dense are you? It has nothing to do with causing more or less interference with regard to reciprocity.

> CB'er ever played by the rules?

Good point, there are enough examples of that right here on this news = group.

> Look for them to buy Ham two meter rigs,
> modify the TX, buy an amplifier with five watts in, 100 out and modify = it,
> too. They will ruin the MURS frequencies within five years. Mark my = words.
> Remember when CB was licensed and limited to 4 watts? Good concept, = but it
> was doomed for failure from the outset. The MURS frequencies will meet = the
> same fate.

Maybe or maybe not. The Ham Fox hunters will have a field day tracking = down the bozos, on VHF it is much harder to hide one's activities and = location. The real concern is not the running of power, but the fact = that the idiots who do the above will find it almost irresistible to = dial their modified 2m rigs down to the Ham 2m band to take advantage of = the nation wide system of repeaters, some linked in to multistate = coverage systems, for a quick QSO with other like minded pirate = operators. The reason they would even consider dropping down to the 2m = Ham band is due to the fact that many businesses still use the now = unlicensed MURS frequencies, and likely will continue to do so. This = could make the current problem with intruders on 10m and 12m look small.

Tell that to Mirage amps, RF Concepts, Beko Elektronik,etc. They do a =
tidy amount of business selling V/UHF amps, and they DO make a =
difference on those bands with or without skip conditions. You'll be =
hard pressed to find a serious V/UHF operator that does not own an =
amplifier. I own and use several myself.

MURS?
> Oh wait, nevermind, Mirage already makes those. TeeHee!

No they don't Randy. They do make dual band 2m, 70cm FM only amps, and =
only two models at that. The BD-35, which I use for my dual band HT, and =
the higher power version the BD-38-G. Both amps are for FM use only, and =
the output drops off real fast outside of the Ham Bands they are tuned =
to operate on.

Could anyone please direct me to a site which defines
Packet acronyms such as SABM, SRQTPQ, APW245, etc.
Thanks

YOU are the one saying it is irrelevant, and seem to think you need to
argue that it isn't. I just said it has become LESS relevant... and
that's a FACT.

I'll ship you all the boat anchors you want - at YOUR EXPENSE... just
make a deposit via Paypal for everything you want :)

Let's start with a couple of old, and very large, MOCOM-70s that I
converted to run digital on 50.14 in the early 90's, OK? The relays
are still good on the beasts. However, you should be aware that they
DO have a propensity to set car alarms off when they are in need of a
tuneup. I'll throw in the service manual if you buy both. Shipping
and Handling charge for each radio - $50.

Stewart - N0MHS

P.S. I hope you have a good Service Monitor - you are going to need it.

Stewart, let's cut the nonsense and I'll ask a serious question - why do you seem to believe that amateur radio stopped with spark gap in the early 1900's? I've got news for you - the latest and greatest in cb could be cut to ribbons with amateur technology in the 60s - I know, I was there. What is it that you do not understand? My 440 MHz handheld runs only 6 aa alkaline batteries, yet is capable of using (not just opening, USING) repeaters 100 miles away. I've talked with guys on handhelds up in Watertown, NY - a good long ways from here - on the handheld. And this is old technology! You'd best brush up on PSK-31 and other modes before you continue to insert your foot in your mouth.

Boat anchors exist everywhere. Get back on subject. Just exactly where do you think that anything without a license (including CB) has more to offer than something with a license? Please be specific.

Thanks & 73 from Rochester, NY
Jim

ps - I talked with Norm, VK2NP, in Brisbane, Australia, many many times using RTTY. Yep, old technology. Did it in the 60s. Go ahead and tell me how fantastic the internet is. I used to type 90 wpm on a 100 wpm machine in the navy and could keep the old 60 wpm machine in the shack going without interruption. Ok, you can cut and paste 3,000 wpm with the internet. How fast can you get information out on your own without simply copying someone else's information?

pps - the amateur scene is considerably faster than you may suspect.

Greetings. I have a just few eEproms (bought from Pac-Comm) trying to run some Pac-Comm Tiny-2 TNCs, also bought from Pac-Comm, but for some unknown reason, the TNC will reset and the eEprom will lose all user parameters and revert to default settings. This takes me off of the air, as I'm trying to use one for APRS, but I can't keep one up for more than a day or two before the default settings reappear. I have spent hours with them on the phone teching the problem, with no success. Does anyone out with a programmer for this old IC have the ability to reburn this eEprom with my user parameters written into the default, so that when the unit resets, it will still be in an "on the air" capable APRS mode? I need to edit in about 12 settings or so, and since I bought these eEproms from the TNC manufacturer, I don't believe that editing and reburning the eEproms would be infringing on their copyright. Any help here appreciated. Please reply via e-mail to gavilan1@earthlink.net.

Nobody is using illegal amplifiers on GMRS/FRS - why?  Because it
makes no pratical sense.  If the MURS/FRS/GMRS channels get so crowded
that people need to resort to amplifiers for the reason you cited -
then it is simply time for the FCC to add more channels to these
```

services... didn't think about that one, did you?

You see, you are still trapped in trying to equate 11m CB with FRS/GMRS/MURS - and it just doesn't work. 11m CB might be "frequency constrained" - but, with channel narrowization, there are PLENTY OF UNUSED FREQUENCIES on VHF/UHF for small footprint public services... besides, if these folks are putting it to such good use, then the hams shouldn't mind giving up a few VHF/UHF frequencies too, right? Try scanning them sometime - they are VIRTUALLY UNUSED.

I have been looking for a wiring diagram for the KAM XL and the TenTec Omni VI that shows how to utilize the RCA phono plugs on the back of the TenTec instead of going through the microphone connector. My main concern is with grounding.

It seems that I can receive fine with only using the center pin from the Kam to the Tentec; however, when I try to utilize the CW mode (I connect the cable to the center pin for an RCA connector that goes into the RCA phono plug labeled 'KEY' on the Tentec, I am unable to get the TenTec to transmit via the KAM.

Thanks for your assistance-- 73's

Mike

For crying out loud - this was 35 years ago.

The world has totally changed - everyone has cell phones now(except me). The govt. is far more prepared to handle emergency comms these days. I'm sorry to say, but I think you are living in the past.

But - if you must know, I don't believe ham radio is completely pointless yet... but it is heading in that direction.

You know what - I'm starting to think that's why the FCC goes ahead and simply allows all these CBers to have illegal amps - it is a valuable National Resource :^) Could come in quite useful in an emergency.

I am not understand your point??
I said I want ACARS and HFDL decoders. I am not interested in HF packet so MixW is not a solution, because it doesn't
support ACARS and HFDL.

I have been running skysweep demo for couple of days and it was first little difficult to understand how it works.
But, it's very logical and provides much more flexibility than other programs.
By the way, there's now reference manual in their web site.

Tapio

Hi,

In July I will be on holiday in Malta (9H3Z will be the callsign). A soundcard interface is in the works and besides SSB I plan to work PSK from there. Since the whole setup seems so easy to work with I wonder if there's a way I would be able to check my mail with soundcard/software via pactor or packet? Packet works with AGW driver (at least in receive).
What would be the best way to go to have access to my e-mail? I looked at the winlink system which would suit my needs but as far as I could find there's no soundcard support.

Any other possibilities??
I only want to be able to send/receive a few short mails for skeds or info to the homefront (no 3rd party..)

TNX.

Bye Maurice

Duh, why don't you read the message before bitching?

I didn't spew the message -- the idiots at AT&T Customer Support
spewed that message into every newsgroup they carry on their news
server. Their "support" idiots are so clueless that they didn't
realize there are other people in the world who are not stuck being
AT&T customers.

If you've got any gripe about the message, take it up with the
idiots who posted it.

Linux is shit when it comes to sound cards. Most Linux people
don't even know a sound card exists yet.

Write to Bill Gates. He'll let you pour through his source code too.

Why not just fucking use it, eh? It's fun.

Sheesh.

It's not public domain, and if the source code were released, then the hackers would really have a field day, or worse, Hams would modify it and we'd have 20 versions like NOS had. Mostly ego trips.

If you want to do something useful, go take a look at Speak Freely. That's the main software it uses, with a user interface on top. Speak Freely has been debugged for years.

If you want something to pour over, I suggest Microsoft Money. They need all the help they can get.

You really have to know what you have before you can know how to maintain them, or if they are compatible with your usage.

REAL gel cells are plentiful and available in a variety of AH ratings. And most do not leak at all, even if turned upside down.

Maintenance Free car batteries often use a calcium additive that reduces the electrolyte loss and allows a greater margin for overcharge. This doesn't hurt the ability to supply adequate starting power, but makes for poor deep-cycle performance, and recovery after a deep cycle. They also tend to leak at the post, making them no better than a REAL deep-cycle Marine or Golf cart battery that allows you to add water as needed. BTW I have seen Golf cart batteries on sale at CostCo for a great price.

All I was stating, was that if you were for some reason forced to use a car battery, you would be better off with a Marine/starting or RV battery, than with a stock type car battery.

However, I don't see why anyone would want to use a stock type car battery unless they had a bunch of junk cars in the yard, and a low current drain accessory to run, like an old CB or 8-track stereo, because stock type low-maintenance or maintenance-free car batteries don't keep well in this kind of operation.

>To believe otherwise is foolish and myopic.

FRS has been with us for a few years already with radios available that anyone could afford. How long will it be before FRS is totally overrun by nonsense, 20 to 30 years?

MURS activity in my area has dropped since it first became legal. I expect to hear a small increase in use when MURS specific radios become available but I don't expect to hear the armageddon that many are claiming.

Most who will be attracted to MURS will not want to put the effort into a monster station (which would do little good anyway.) If they want greater range they'll stick with their cell phones.

I have yet to hear an echo box on FRS.

Roger beeps were initiated by radio manufacturers, not users of FRS radios.

If you hear roger beeps on MURS you can thank the manufacturers.

The one real live problem I've heard about on MURS (as far as
non-certified radios) was with Ham operators using their 2m radios on
MURS.

The fox hunts will turn up some of their own people.

When is soon? CBers like to talk skip. Do you expect a particularly odd sun cycle that will allow skip on VHF?

The only people who will come close to causing problems on MURS are those who will pay less than $30 for their radio and those radios will not have the range to bother anyone.

Why would anyone give up all their high powered CB gear that talks all over the world for more expensive equipment that might possibly talk to the next town regardless of power?

Mike,

Are you suggesting that MURS operators might stage a "Boston Tea Party" to
acquire additional channels?

Stewart, I'll be dipped. You missed the point again. Too bad you were not (obviously) in NYC on 9/11. Go ahead, use your cell phone - IF you can. Amateur radio certainly can't provide the huge infrastructure that commercial concerns can, BUT ...

Beyond that, amateur radio SHOULD be about learning. I've tried to argue that what is being done at my employer's place for data collection is not the way to do it. I think I'll simply leave the latest issue of QST lying around the plant. Maybe someone will read the article on hidden packet stations and come to the realization that what I've been saying for two years is correct. This does relate to amateur radio - do you think we are all still using spark gap and cw or what? I've got news for you - things DO change, but PRINCIPALS and CONCEPTS still apply. 500 volts from that boat anchor can still kill you, despite the fact it was built 50 years ago. Internet, packet, amateur radio - they all have some common grounds. Allowing a CBer a 10,000 watt amplifier will only add to problems, not provide solutions. Your problem is very common - I see it at work every day. This is going to get REALLY funny. I can now retire (I hit 55 on the 21st). You see, many people at work have the same perceptions you do. Once my retirement papers are signed (which won't be for a few more years yet - I want more pension), I will be demonstrating an interesting program. I did it once before with the old Texas Instruments ladder controllers. I wanted to do it 6 years ago (but the young very important folks said - it won't work, you won't have all of the CPU instructions in it - listen to this, Bill Gates!). I can program any of the Allen-Bradley SLCs in under 15 minutes with nothing but the I/O listings. It will be far more efficient than the code they currently use (a 35 ms scan time will be brought down to well under 5 ms). Unfortunatly, I had to sign an agreement with my employer which forbids me to work for a competitor for 2 years - but this was done on MY computer AT HOME with MY software. It has been costing them over $200,000.00 per year for the last 5 years. I will demonstrate it. It will automatically place an OEM LOCK on the program in the controller at which point they can alway leave it in or put their old software back into the controller. My software has a copywrite. Tough ...

BWHAhahahahah

What is pointless is the attitude you and many others display. It is costing FAR more than you will ever have a clue.

Here's to 'pointless' amateur radio!

Jim

That was done years ago and we now have a legal service that will
continue to operate with very few problems for years.

Additional channels are not needed and will probably not be needed for
some time.

Mike

stewart,

The likelihood of more channels being added to FRS/MURS/GMRS is very small. If they turn into a 'FUBAR' like other services have, it's a more likely possibility that they will be deregulated and enforcement turned over to local government agencies. Come to think of it, with no license requirements for FRS, it already falls under PL-106-521. Oh ho!

It makes no sense to someone like us who has some technical background. It would appear to make a lot of sense to someone whose extent of technical knowlesge is limited to or focussed on figuring that 100 watts has GOT to be better than 4 watts because that's what happens on 11m and anyway it's more watts.

Consider that I do get greater range (can hit repeater or fixed stations further away) with my 50 w 2-m rig than when I crank it down to 10 watts. It almost makes the ",ore watts is better" argument.

I've been on 2-m proving that for the last 40 years.....

It all boils down to whether the use of amplifiers to increase the power output of a MURS or FRS station is legal.

It is not.

A regulatory policy decision, not a technical decision.

The reason is that The Congress does not want to fund the FCC field enforcement function at a proper level. Put the proper number of agents on the street (about 10-15 times what is there now is a good start) and nrvrddstu mstvchingotfrtd yo yhr Justice Department to stop kissing off such cases and you will see a marked difference/cleanup of all such problems.

The last people that the gov'mint would entrust backuo communications to is the "I have a good afterburner" crowd.

  See my earlier posting about the Boston Tea Party. It had nothing to
  do with taxation and the King.  It had everything to do with
  protecting something that today would be shut down umder the RICO
  laws and the "Patriots" sent to Lompoc or Butner FCIs.

Only if the emergency did not require ACTUAL communication. CBers with illegal amps have perfected the art of "one-way communication". Thier technology (if you can call it that) is all concentrated on one goal: transmitting the loudest possible signal. The receiving side of the equation (DSP filters, narrow IF filters, audio passband filters, directional antennas, etc) is totally ignored because it isn't relevant to them.

We already had a "VX-5 Tea Party"... but now that all the old Part 90
radios have been made compliant - and all new radios only have to meet
Part 95 regs - the citizenry has been appeased.

Yes - I think the "Boston Tea Party" analogy is a DAMN good one. I
wouldn't look for anything else like this to happen for a couple more
years, however. Right now, we are going to have to fill up the lower
three MURS channels.

Could we see consumer MURS radios by THIS Christmas? I hope so - and I also hope they come with removable antennas(BNC connectors preferred).

I'd love to see a T7200 clone for MURS(with Wx), but with a BIG removable antenna, and FULL 2W TPO on all 5 channels. Even if it does cost $129 - I'd buy a pair... eventually the price will drop below $100 at Wal-Mart...

> Stewart, let's cut the nonsense and I'll ask a serious question - why do you seem to believe that amateur radio stopped with spark gap in the early 1900's?

I don't - you misinterpreted the point of my post.

What I'm saying is that Amateur Radio has slowly become less relevant in the last 10 years, but the trend is accelerating. As this trend continues, the ARS is losing it's PURPOSE... this is especially true on the VHF/UHF bands, whose use has dwindled to the point that they are VIRTUALLY UNUSED. Even 2m has no more than modest activity - other than a few high-level repeaters, and an occasional simplex or packet QSO, or some folks doing EME... NADA.

Why not open up 1.25M for a new NoCode Novice Class? At least then we could start getting families/friends/collegues involved with Amateur Radio. Otherwise, why not just let the public use these frequencies? They aren't being used for anything.

Stewart - N0MHS

Good news, Stewart! I just checked, and 222-225MHz is open to NoCode licensees. I think it happened back in about 1991. And 219-220MHz is available for high speed data links up to 100KHz wide. Yes, to NoCode licensees. Go do something cool!

Amateur Radio has changed. That is a fact. The reason it
changed, is that you can't build a radio cheaper than you can buy it.

All those Hams who could build a radio, are dead and gone.

What that leaves, is the Hams who like to interface things to a
pre-built radio. There is a lot of experimentation and fun in doing
those projects.

Radio is not the fascinating thing it was in the 60's and before.
Radio is boring since the invention of the CD. Not many people
stay up all night to here a far away AM station like we did as kids.

Radio is an appliance to Americans, not as much a hobby anymore.

The numbers will never again reach what there was at the peak
of Ham radio. The commercialization of RF to one or two
companies in America will continue, and Ham radio will go to
the same place that model railroaders, and slot car racing went.

Hobbies die, and people die. MURS is still-born.

Well, everything changes. Vinyl records are gone, but does it mean the music industry is gone? Are musicians gone? Likewise, amateur radio has changed, but it continues and is quite relevant today. If you understand packet, you won't have any problem understanding how many devices communicate (the first foreign language is difficult; others become easier). You mention the repeaters. Heck, we have a pack of 'em here in Rochester, NY. No, they aren't busy a good deal of the time (like at 3:00 am local time - but I've had interesting chats at those odd hours of the morning too, so they aren't dead even then). The purpose SHOULD be about learning. Just opening up frequencies for unlicensed use won't further learning. There are already a good number of frequencies for unlicensed use (even for wireless local area networks). One of the repeaters here locally is connected to several ports connecting 10, 6, and 2 meters as well as 220 and 440 MHz. I've had chats with stations in England and Australia over these (no, not internet linking - all rf paths courtesy of that 10 meter port). That said, this was just a simply recreation at the time. The learning is what pays off for everyone. Most hams have never been involved in an emergency. The point is that many are trained and could offer assistance
if needed. I guess the best I can offer is this - hospitals have much more equipment and doctors available; therefore we should eliminate ambulances. Right? No, amateurs cannot compete with the huge infrastructure that commercial firms have provided (I've stated that earlier); but some communications are better than none. Don't bet the farm that adding another 10 million people using FRS, CB, MURS, or whatever else that doesn't require a license is likely to help in a real emergency where telephones and power are out for many miles around.

73 from Rochester, NY
Jim

ps - there are a ton of bands for codeless techs. That is fine. If you suggest they should be open license free, then recheck this post.

People who died 10 years ago, are still listed as Hams.
Don't believe the numbers.

The other statistic tool you must know about, is per-Capita. That is,
how many Hams per 100,000 Americans in age groups like
9-12, 13-16, 17-20, 21-30, 31-40, 41-50, 51-60, 61-70, 71-80?

Have those gone up? No, they've gone down.

That doesn't match my experience.

I've powered an 100-watt HF transceiver, a 25-watt VHF transceiver, and
an AM/FM receiver (for easy listening), plus occasionally even the lights
(when the mains are off) in my shack for over 25 years using stock lead-
acid batteries from my local discount store.  They last about as long
(3-5 years) in my "shack" as they do in my automobiles.

Don't know about slot cars, but model railroading is alive and well.
They have new technology, called "DCC", where each locomotive
has an addressable decoder and you have handheld controllers
to control individual trains anywhere on the layout. Some of these
handhelds use a radio link instead of a wired link. Frequency around
900MHz.

Four clubs to which I belong (W0EF, K0RT, W0YC, and W0TDX) use 1.25M for extensive digital and analog links for contesting/DX packet clusters, and remote receiver and crossband 2M/75CM repeater links. Additionally, several 1.25M repeater pairs are very popular in our area. I notice that there are at least a couple dozen 1.25M repeaters in San Diego county. And In case you missed it, Amateur Radio is in fact "public use" of these frequencies.

The latest MURS rules changes now simply limit transmitter power output to 2W, and remove the old 2W ERP restriction:

http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-02-139A1.doc

This effectively raises the ERP limit to about 10W for omni base stations, and about 50W with a directional beam antenna.

With licenseless services like MURS beginning to flourish, Amateur Radio just keeps getting less relevant.

Hi,

I am interested in finding a protocol stack (Layers 4 through to 2) which I could use over a point to point radio link.

I have my own physical layer and need something I can use for demonstrations. I need something written in C preferably which I could use under Linux which would provide me with a mechanism to take my user and control plane messages, frame them with addressing information and then pass onto the physical layer. I would like to implement some form of retransimission scheme plus compression if possible.

Not being familiar with what is available in the ameteur radio arean, any help appreciated.

Thanks in advance,

Tom

Not so! The Ham freqs. WILL continue to be relevant. Look for the CB'ers to get into these five freqs and ruin them. Two watts? Bah! Since when has a CB'er ever played by the rules? Look for them to buy Ham two meter rigs, modify the TX, buy an amplifier with five watts in, 100 out and modify it, too. They will ruin the MURS frequencies within five years. Mark my words. Remember when CB was licensed and limited to 4 watts? Good concept, but it was doomed for failure from the outset. The MURS frequencies will meet the same fate.
The MURS frequencies will soon be yet another cluster f*ck akin to the

eleven meter band, and the FCC will have not the resources to police the
miscreants. It will be interesting to see how much interference these "new"
CB freqs. cause to the nationwide cable TV system, too.
It will only get worse as power contests, filthy language, arguments,
malicious interference and general eleven meter intellect creates havoc on
these five frequencies. Ol' Bubba with a cheap, ungrounded station and a gut
full of Old Milwaukee is gonna have a ball!
Once the radio mfgrs. get up and running (making $$$) all Hell will break
loose. I give it five years, tops, before the rabble rousers ruin it for
all.
Gee...yet another FCC idea gone bad.
And the FCC wants to usurp some of OUR bands for commercial interests? This
makes you wonder who the Hell is watching the store, eh?

You fail to mention that FCC degraded MURS from Part 90 to the Part 95 (CB) category, removed some previously allowed modes, and specifically requires that the radios be certificated, thus blowing away your outlaw chant about using Yaesu VX-5R.

Bottom line, it's a 2W CB service, good for not much more than a local intercom service. Fine for some limited requirements, but hardly competition to the worldwide capabilities of even a very modest Amateur Radio station.

With all kind wishes,

de Hans, K0HB

A couple years ago TAPR hired Dandin to finish their Spread Spectrum radio. Since that time, the radio has been pretty much a dead issue. No updates have occurred to TAPR members since that time. Even Dandin (The TAPR President and another Hams startup) has pretty much died as an 8A (minority owned) entity.

About 6 months ago TAPR tried to insert itself into the digital voice interest group. It took 4 months for the web link to begin, and since that time, has had no updates.

TAPR is dead folks.

It was a pretty good organization 10 years ago, but is completely dysfunctional and broke today.

Go look at the web pages. It's all old information from 1999.

I'm not all that sure that they will; retail price for a decent VHF FM
HT, allowing for a reasonable profit, probably bottoms out around $30.
Retail for an FRS is around $30.  Retail for a low-end CB is around
$50.  Which will people want: 14 channels of burping cussing and farty
noises, 40 channels of burping cussing and farty noises, or 5 channels
of burping cussing and farty noises with the occasional Taco Cabana
drive-thru order on one of them?

Your Linux kernel has the AX.25 protocol suite built-in.  Maybe you need to
enable it in the configuration, but many distributions have it included by
default (as modules).

Compression is not included in the protocol but can be added at the
application layer, e.g. via zlib.

Hey, Richard,

What voltage setting did you end up using?  I spent $toomany on a
"smart" charger but I have a couple older PS's about that I'd like to
use like you do the Astron.
TIA
K3DWW

It was so long ago I forget. I contacted the manufacturer of my "deep cycle / marine" battery and asked them for the long term float voltage and set it to that.

I *still* have to monitor the liquid level, but it does not disapear anywhere near as fast now.

Industry standard float voltage is 2.3 volts per cell.
That's 13.8 volts for a twelve-volt lead-acid battery.
We use 54.something volts for a 48 volt string in telecom.

>
> You fail to mention that FCC degraded MURS from Part 90 to the Part 95 (CB) category, removed some previously allowed modes, and specifically requires that the radios be certificated, thus blowing away your outlaw chant about using Yaesu VX-5R.

However, the restrictions on what types of pre-5/2002 Part 90 certificated radios will be allowed on MURS has been greatly reduced. Now, most any 2W-under Part 90 radio will be allowed.   Along with the 2W Transmitter Output clarification, this was the most important part of the ruling, as there was great confusion as to what was legal.

> Bottom line, it's a 2W CB service, good for not much more than a local intercom service. Fine for some limited requirements, but hardly competition to the worldwide capabilities of even a very modest Amateur Radio station.

The capabilities of a well built MURS station can now compete with those of a Technician Class station.   Furthermore, MURS users have certain privileges that Amateurs don't... for example, MURS users can do business, or download short e-mails of any type of content to their Mobile PDAs from Internet gateways.

The fact stands - MURS has been made a more capable service, and now offers capabilities and privileges on the order of those of the Amateur Technician Class license.

What's wrong with that?

Anyway, the fact is, these radios have far better receiver specs than
do most amateur radios.

So, if you're gonna play - why not play with the best?

Not even close to being comparable.

MURS -- 5 specific frequencies, less than 100 Kilohertz of total bandwidth.
Tech -- Millions of frequencies 23,962,000 Kilohertz of total bandwidth.
Advantage Tech 239,620-to-1

MURS -- One band
Tech -- Seventeen bands
Advantage Tech 17-to-1

MURS -- 2W output
Tech -- 1500W output
Advantage Tech 750-to-1

MURS -- Antenna height 20'
Tech -- No antenna height restriction.
Advantage -- Tech

MURS -- FCC certificated radios only. Modifications illegal.
Tech -- Free to use any purchased, homebrewed, or modified radio without FCC certification.
Advantage -- Tech

MURS -- Operation restricted by US borders.
Tech -- Reciprocal operating agreements with nations all around the globe.

Advantage -- Tech

I could go on and on, but I'm sure you're getting the picture!

Comparing MURS to even the lowest privileged Amateur Radio license is like comparing a tricycle to a Lamborghini, and the comparison suffers even worse when you compare MURS to a General or Extra class Amateur Radio license.

That is an over statement if I ever saw one. MURS can no way
compete with any part of ham radio, even Tech class stations.

> Furthermore, MURS users have
> certain privileges that Amateurs don't... for example, MURS users can

Big deal, there are cell phones for business and internet for
e-mails.

>

Really, how many frequencies for MURS as compared to those
available for Tech class licensees? Compare the power levels
allowed by MURS as allowed for Tech Class. You must be dreaming.

True if all you want to do is this one thing. But what other license is

there
that lets you use various different modes in various different kinds of bands? I could drive home with the 2m rig in the car, and once I'm home I can work some DX on HF with CW or SSB or amtor or such.

"Arf! Arf!" <DoggieDaze@Liberalz.com> wrote in message
news:<ackekk$dq5$0@pita.alt.net>...

This is the same old argument that we've been hearing for years... FRS will become just like 11m(with illegal amplifiers), or MURS will become just like 11m... of course it has been proved completely wrong. The reason that folks on 11m went to amplifiers was because it actually helps them increase their communications range - the fact that they interfere with others when the skip is out is simply a side-effect. With no skip, there is no incentive to go with exceedingly higher power in the first place, because it serves virtually no useful purpose on VHF/UHF.

So - you're going to have to come up with a better argument, this one
just doesn't wash any longer. Thankfully the FCC has figured this
out... too bad many hams haven't.

Stewart - N0MHS

There's the "no business" rule for ham radio. Which is actually an
advantage for hams in that we don't get invaded with business comms
eating up all or bandwidth. Lawsuits over QRM, etc.....

Heheheh ... sure .... <chuckle chuckle>
Um, what makes you think one can't do e-mail with amateur radio?
Of course, there is fast-scan television (regular tv) as well as slow
scan tv. Uhhhh ... I sometimes take my HT (walkie talkie) to work to
use during lunch. I've chatted with Australia, England, and other
parts of the world ... no, not using internet linking - all rf path.
This was with 6 double a alkaline batteries on FM (voice). I've had
folks argue that one can't cut through one of those alleged 70,000 watt
shoot-out stations. Can't fight the carrier. Hmmmm ... only need to
be a short way off the carrier. There are modes that can be copied some
30 dB BELOW the noise level. 50 Hz bandwidths and less (another 20 dB
gain). Actually, it should be possible to cut throught that 70,000 watt
am signal with 100 watts (properly done, of course). Oh .. internet ..
yep, can do that too ... but tell me how you work Australia all rf path
on 6 double a alkalines ... with a walkie-talkie .... running all of 4
watts .... into a whip ... and that only requires a tech license. What
happens if you have your extra?

BWAaaaaHAHAHAHAHA

try again from Rochester, NY

```
Jim AA2QA

ps although business use is not what amateur radio is all about, what is
it that makes me think that business use is not at all on your mind?

You're right on the money! I said this long ago. The MURS will be
adopted by the truckers and you can bet your bottom dollar that all 5
MURS frequencies will sound like CB Ch. 19.

On June 6th, 2002 AT&T Broadband will restructure the configuration of the servers, which provide access to Usenet newsgroups.

As a result, you will need to update your newsgroup settings. If you fail to update your settings will be unable to download new messages, post new messages or post replies to existing messages to newsgroups.

For Outlook Express Users:

First, Remove (Rename) Existing Account (you must do this first):

1. Open Outlook Express.
2. If your folder list is not automatically displayed, select the VIEW menu, then click LAYOUT. Click FOLDER LIST, then OK.
3. Click the netnews.attbi.com folder to create a list of newsgroups to which you currently subscribe.
4. Select the TOOLS menu, then ACCOUNTS, then the NEWS tab.
5. Select netnews.attbi.com and click REMOVE. Click YES to confirm.

Then, Create a new news account:

1. Open Outlook Express.
2. Select the TOOLS menu, then ACCOUNTS. Click ADD, then NEWS.
3. Type your name as you would like it to appear and click NEXT.
4. Type your e-mail address in the format username@attbi.com, then click NEXT.
5. Type netnews.attbi.com in the news server field, click NEXT, then FINISH.
6. Click CLOSE.
7. A prompt to download your list of newsgroups will be displayed. Click

YES.

8. Choose the newsgroups to which you would like to subscribe and click SUBSCRIBE.

Additional information on subscribing to newsgroups is available on the AT&T Broadband Online Customer Support Center at https://help.broadband.att.com/faq.jsp?content_id=1731&category_id=68#configure

Not really...it means we can get rid of those that want to order a pizza via the autopatch, those that have no idea at all what ham radio is supposed to be, and maybe we could use some thinning out and getting back

to basic. Then maybe the un-informed crabbing about what the 'service' is
all about will stop because those that are left will actually have read part
97.

All this talk about MURS, like it has anything to do with what most people consider amateur radio! Amateur radio is much more than simply transmitting and receiving. Heavens!

If I need convenient, reliable communications with other people, I use a cell phone. Sure, under extraordinary circumstances, amateur radio may be more reliable, but 99.9% of the time, I'm way better off with my cell phone than my ham radio.

That's a load of horseshit that a vulture wouldn't touch. You can't work what you can't hear, and the only way to find a signal near the noise floor is to improve your antenna. Even if the "other guy" gets a linear, you still have limited range because of the crappy propagation of the band. The only reason people buy linears is because of the king-of-the-hill mentality that most of us abandoned after grade school.

> - the fact
>that they interfere with others when the skip is out is simply a
>side-effect. With no skip, there is no incentive to go with

>virtually no useful purpose on VHF/UHF.

Amps interfere with others, skip or not. Part of the "skip" they complain about is bleeding from overmodulated radios and crappy amps, and part of it is the normal increase in the noise floor from local signals as the band use increases in the daytime hours. Anyone with a scanner knows the latter is true because the exact same thing happens with the cordless phone channels. So considering both those problems, I can just about guarantee you that the same thing is going to happen on FRS and MURS as it happened on the CB. And they will use the same lame arguments to justify the use of amps, and for freebanding on nearby freqs.

>So - you're going to have to come up with a better argument, this one
>just doesn't wash any longer. Thankfully the FCC has figured this
>out... too bad many hams haven't.

The FCC wears blinders to both reality and criticizm. When the abuses with CB became excessive they ignored the problem and dropped the license requirement. Their current reasoning for FRS is that they implemented manufacturing requirements that would prevent abuse, but they totally ignore the resourcefulness and determination of the

pirates, as well as the historically high profits from illegal radio
equipment. The existence of any band with little or no enforcement is
just asking for trouble, and the abuses will continue until the
Commission pulls their heads out of [the sand].

For the most part, there is very little action on any VHF/UHF band other than 2m.

> MURS -- 2W output
> Tech -- 1500W output
> Advantage Tech 750-to-1

Unless your doing something bizarre, like EME, anything over 5W is basically overkill. 2W TPO is decent, if you've got a good antenna.

And even 2m has gone dormant in recent years. Other than a few high-level repeaters, the band is virtually unused.

So Sparky, got any suggestions on building a dual band amp for FRS and MURS?
Oh wait, nevermind, Mirage already makes those. TeeHee!

Most people nowadays go on the Internet when they get home, and can reliably talk just about anywhere in the world for free.

But, in any event, I'm basically comparing MURS to Amateur Technician 2m... there is now very little difference between the two. Hams have repeaters, but most of them go unused these days, and any of the good ones cost you money - so you might as well get a cell phone.

The biggest kicker is that, with ham radio, you can't even talk to your friends, family members, and co-workers. This is why I've continued to push for re-opening up the Novice Class as a no-code VHF/UHF-only license - at least you would have somebody to talk to on VHF/UHF.

I disagree, for the average Tech with a 2m handheld, a 2.1m hanheld
will compete quite nicely.

Anything over 5W is overkill for anything other than bizarre

applications like EME... 2W is plenty with a couple of good antennas
at each end of the link.

This statement strikes me as rather ignorant of reality.
If you're having fun using MURS, knock yourself out. If
MURS is as good as ham radio for you, that's your thing.
It just doesn't seem to make much sense for most of the
people I know in ham radio.

Dana

FOR FREE?  If you mean via the computer, there's still the ISP monthly charge
or its equvalent (the DSL line, cable modem, T1, or whatever).  Who provides
that for free?  If you meant free = "no additional charge", you failed to
account for the hidden monthly charges I just stated.  Then, there's the
indirect charges, such as the electric bill (most people pay a power company,
or for gas for their generator, etc....).

Maybe they only go unused when you're around because no one wants to talk to
you, or like the people on this group, they've already "heard it all" from you!

Absolutely. What is wrong with that? Again, do you have some kind of
point? I suppose not... and it seems that is the underlying problem
these days with Amateur Radio - it is basically pointless.

> taking comparisons seriously.

Moonbounce? Have you completely lost all touch with reality? The fact that is basically all Amateur Radio seems to have to offer on VHF/UHF for a Technician operator PROOVES how irrelevant ham radio is becoming

Repeaters, maybe... but moonbounce? Give me a break.

Stewart - N0MHS

P.S. You can already do repeaters on GMRS, and I suspect that MURS will eventually be expanded to allow low-level repeaters on certain new frequencies... I'm been pushing the idea of a crossband VHF/UHF repeater capability, so Joe Average homeowner can set up a repeater site inexpensively.

Aren't you forgetting the "All above 300GHz," which technically means
that Techs have an infinite amount of bandwidth? (Though building
those 300nm yagis can be a pain in the ass)

Also don't forget the little bonuses like IRLP, other link systems,
and in general, the ease of finding repeaters on 2m and 70cm. Even if
they allow repeaters on MURS, you won't be able to find enough of them
to give reliable comms over more than a couple of miles.

Nope, it just hasn't had time yet. There are still way too many
people out there that aren't familiar with FRS. Once they start
fiddling with it, some of them will start ruining it, and it will be
all downhill from there.

Do if you got about 300 murs talkies and fastened them at the correct spacing interval to a fiberglass boom, and had a way to key then all simultaneously...

Recommendations vary among battery manufacturers and even for models made by the same manufacturer. Get their specifications and follow them.

Remember that float voltage is temperature dependent, and the specified voltage usually is at 25 degrees C. For other temperatures, compensate according to the manufacturer's spec (-3mV to -5mV per cell, per degree C). If you see a lot of temperture variation, consider getting a temperature-corrected charger. Your batteries will last longer!

The fact stands - the only reason that there is a "MURS" is that folks went to the nearest CostCo or BestBuy and bought the JobComm or Color-Dot radios which were intended for small business use WITH A LICENSE and then started using them without benefit of same. This is criminal behavior no better than the ham-band "bootlegger" or the broadcast "pirate".

The Commish'- to my deep disgust - was more interested in getting more economists and phone-company=merger specialists on board - folks who had no concept of what radio regulation was all about or should be - than in putting more law enforcement agents on the streets to clean up the mess, and the rest is history.

Two methods of Rules changes - go through the procedures starting with a Petition for Rulemaking, or just go ahead and do what the law does not allow you to do and if enough people do it the gov'mint will turn chicken and leave you alone.

The second method makes me sick.

<Enough ranting>

  The FCC created MURS because Washington didn't want to bother
  enforcing the rules.  See my other post(s).

On HF, the best approach is to use the same amount of power as the station you're trying to communicate with, and use the best antenna possible. The same hold true on VHF, except that at a certain point, increasing power will do you no good, because the other station is out of LOS.

The point is - Amps are more useful on HF because of beyond LOS propagation - therefore they exist... it really does no good to use amps on VHF - their are of course a number of ways to increase LOS comm range, increasing Tx power is one of the least efficient(and ineffective after a certain point). I've written a web page about the whole deal:

http://www.geocities.com/horseshoe7/repeat.html

So please, do try to feed me a bunch of happy horsecrap about using amps on VHF/UHF - it is VIRTUALLY USELESS. You tried to apply my statement in the wrong context, and got yourself 360 degrees turned around - you tried to argue with me, but just ended up agreeing with me.

Hi Ted,

Many thanks, I was aware of the page in the manual but was having
problems getting it working. All sorted now.

73,
--
Roger Basford

Paul Erickson MOSB [Man of Steel Balls]
R. Don's Show is studly! Here's what some guy sent him!

Steel Balls is on LIVE365 with Date and Mate Talk Show

This is typical of a guy who finally is FED UP with being lonely, horny and desperate.
The good news? He's fed up thus [subconsciously] ready for R. Don Steele's Steel Balls Principles.

The BAD NEWS? He crushes his ego one more TIME. He destroys any remnant of self-confidence he had left. He smashes his self esteem down to "I am an unattractive loser."

This is one of THE most common SELF-DESTRUCTIVE things guys do. The Steel Balls Principle is "Don't keep doing the same things over and over expecting a different result."

David did exactly what Steele did when he got divorced at age 42. He thought women went to clubs and bars to meet men so he went to clubs and bars to meet them. He dressed for success. He wasted 1.5 years of his life and an estimated $20,000 after tax dollars learning that the woman he wants to meet is not in a bar or club. The females in bars and clubs are looking for Mr. Rite or they are there for all of the purposes explained in How to Date Young Women, Volume 1, none of which are productive or effective for find-meet-talk-date-mate.

David made 5 MAJOR MISTAKES beyond going to a club.

STEELE will explain on the www radio show Tuesday from NOON-1PM PACIFIC time.

David's story is below the intructions on how to tune in and call in to the THRUTH IN DATING AND MATING show.

GO TO http://steelballs.com and CLICK ON LISTEN TO DON ON THE RADIO, that takes you to live365 and Steele's station. Click on the yellow speaker THEN follow the prompts and you are WIRED for Steel Balls Truth in Dating and Mating. Past shows play 24/7. If you can hear the previous shows, you're in there!   Click PRESET this station Then the next time you go there just click PRESET and your ready to talk with Don LIVE! 562-696-1313 IT ONLY WORKS when he's on the air LIVE.

Don,

Happy Cinco de Mayo!!

I wanted to see if you?d be able to offer me some feedback. Let me start by giving you a brief on me: I?m a month shy of turning a young

41-yrs; been married once before and was divorced after 8-yrs; I comfortably over this former relationship and able to admit my mistakes. I have been solo for 2-yrs. I?ve dated some women, but not many due to my self-indulgence, moving and career-building. I have also been holding out for someone special?yada, yada.

Here?s my story.

I ended up possibly missing out on one to three different opportunities ? all on the same night. I will try and give you the short version.

I went to a live music club dressed nice, but not totally aware of the type of music the band played ? whether it was danceable or not. After one-and-a-half songs, I decided to dance solo ? as many others, of both genders, were. I didn?t concern myself with what others thought, yet at the same time I was probably giving what appeared to be the few single women there a sample of my abilities ? so they?d have reference if I asked them to dance. This very attractive petite blonde came out and danced by herself. I looked at her a couple of times and thought, ??very cute?. She looked at me, but only very briefly. I thought I?d keep an eye on her every so often to watch for signs of interest ? in clusters, mind you. This lady mainly danced by herself throughout the night. She did dance with a couple of girlfriends and with a guy that appeared to be an old friend, but mainly solo. While dancing, she?d dart a glance at me, but look away quickly. Okay, no interest there. I found her attractive and liked watching her move, but was very discreet in my momentary glances at her. On a few occasions, as she moved to where we were face-to-face, I held my gaze on her long enough so if she looked at me I could reveal my interest. She?d look as she would do every once in a while, but eye contact was again brief with a level look away and gave no return smile. I conveyed no interest, turned away and didn?t focus on her. She began moving closer and closer to me while dancing. Still, when our eyes met it was short and no smile. No problem, she wasn?t the only female there. I wrote it off. The closer she moved towards me while dancing had me a little intrigued. She even removed a section of her clothing. She had like a two-piece top that when the outer layer was removed it revealed a backless halter top that was short as well exposing her mid-section ? very sexy! I never let her see me looking at anything other than her face ? as I waited for a return glance. As before, she?d look, but the same story. She would dance within a foot of me, placing her hands on her hip & swaying very provocatively. Several times while her arms swung as she moved she?d graze me with her hand. Seemed like a sign of interest to me. I watched her as she moved around the dance floor and she did not dance this way in as close of proximity to other guys, but still the short eye contact and no smile. The signs were either inconsistent or incomplete. I thought maybe her non-verbal skills are undeveloped. Naw?, she is not interested; I?m kidding myself. Who doesn?t smile or look at someone if they?re interested? I continued to be aloof.

The friend of the blonde was dancing by herself almost as much. I looked her way a couple of times and offered a polite smile. She returned some very warm smiles with the ?longer than socially appropriate? eye contact. I thought, ?Great!? I start something with this lady after confusing the signals from the blonde; she gets mad and says something to this other lady. I looked again at the blonde to offer a chance to give me a definitive sign. She looked a moment longer than before, but pulled eyes away while remaining level. Only difference was an ever-so-slight smile this time ? was she a game player?? The signals were just too weak to be certain; maybe I was expecting too much.

Then I began noticing a third lady ? another brunette, like the friend of the blonde, which is more my preference. She also offered long eye contact and very warm smiles. I thought I was creating an illusion, but then I saw it again.

All three women were petite, shapely and adorable. I felt a bit guilty if I abandoned the blonde because I misread her clusters. All three would dance with someone on an occasion. Sometimes these women would dance with guys, but seemingly unattached. The biggest reason I determined they weren?t their boyfriends was they?d all look over their dance-mates shoulder ? to see if I was looking at them [?]; to convey they?re unattached, the situation was temporary and/or they wanted to indicate they still had interest [?].

I tried thinking of situations from the book ? Body Language Secrets, but could only recall seated or standing examples where the women weren?t constantly sought after like a dance-floor situation. I feel like I choked. And to pour more salt on my wound, I did it three times? all in one night! And another topper, they were all babes. It wouldn?t have been as harsh if they were 4?s or 5?s, but they were easily 8?s or very close and very hot!

Any thoughts or ideas that you could offer would be genuinely appreciated!!

David

Here's how you tune in:

http://www.live365.com/stations/227853 click on YELLOW SPEAKER and follow the "instructions" obviously written by a Programmer. Very corn-Fuzing but possible.

Past shows play 24/7. If you can hear the previous shows, you're in there! When Steele goes live it will drop you off and you have to reconnect!?

R. Don Steele, author of Body Language Secrets: A Guide During Courtship and Dating hosts a live call int talk show four times a week. PACIFIC TIME.

Sundays 5-6 PM

Tuesdays Noon-1PM
Wednesdays 7-8PM,.
Friday 8-9 PM

steelballs.com for excerpts of HOW TO DATE YOUNG WOMEN FOR MEN OVER 35
and photos from BODY LANGUAGE SECRETS. Click on the cover of the book!

I've downloaded Satscape and when I try updating the data, I get the error
"Login failed, can't set startup dir to /home/ftp: No such file or directory."

I can't get it through regular FTP either...

???

Do you have a current version of SatScape, from its own web site rather than some mirror? A few versions ago, it had to be changed to accomodate downloads via http rather than ftp, because the maintainer of the data decided that ftp was insecure for some reason.

The current version is 1.87; I just tried updating the data files with 1.86 and it worked fine. I don't remember which version was the one that switched from ftp to http.

If this is about downloading from celestrak, it has nothing to do with the maintainer of the data. It was the maintainer's ISP that decided that ftp would be closed "because it was insecure", even though the maintainer was opposed to that.

Hi... I've got a Kenwood KSC-14 Rapid Charger for sale.. it can charge two Batteries at a time in either Rapid Slow or Trickle Charge mode.. cost over 80 bucks when new and is in absolute Mint Condition. Designed when I bought it for the TH-79A but the inserts can be changed to accommodate different Kenwood HT's (check with Kenwood 1st)
Asking $40.00 and if out of Pick up area $5.00 shipping via UPS brown label. You can reach me via email at:
jaffejim@erols.com or call 718 268 1691 and yes there is a machine attached to the phone and I will answer all calls regardless of area.. Best 73 and thank you for reading this.. Jim, WA2VOS

>work with UIView32 ?

It's so easy to get UI-View working, either in terminal mode or KISS mode, with a TM-D700, that it is difficulty to understand how anyone could possibly have a problem with it. Assuming all the hardware is working properly, then setting it up takes only a few seconds.

UI-View even has a TM-D700 command file that can initialise the radio from any state, even if the user hasn't put it into TNC PKT mode.

To be able to help any more, you're going to have to provide some more information as to what comms settings you are using.

Hi,

Does anybody know how I can contact KF7XP ?
I've tried the Email address on his current web-site but I just get an undeliverable error!

I'd very much like to get in touch regarding a serial number for the DOS version of his Xpware program (version 1.6)

Many thanks.

Hi Fellow Warblers.. I'm happy to announce that MixW 2.05 "World's Best" is
now available for downloading for all to enjoy..
The Website address is: www.nvbb.net/~jaffejim/mixwpage.htm
The following below are the changes from 2.04 to 205 good luck and have
fun.. Best 73 Jim, WA2VOS

MixW 2.05:

- YAPP file transfer support for PACKET mode.
  Crash recovery is supported.
  See File - Yapp menu:
  - "Auto receive" turns on the feature when MixW automatically opens
    YAPP Receive window when remote station starts sending a file.
  - "Crash recovery" turns on YAPP protocol extension to be able to
    resume partially received files.

- LPT port support for paddle input and PTT/CW output (TRLog-compatible).
  See Configure - LPT port settings. Go to CW settings dialog
  to turn on the LPT paddle.

- Telnet window is implemented to access DxClusters via telnet
  See View - Telnet window menu. See "EA7URC_DXC.scr" as an example

how to automatically login to a node. To automatically run this script when Telnet window opens, define OnOpenTelnetWindow macro as follows:

```
Macro: OnOpenTelnetWindow
Label: - doesn't matter -
Text: <TELNETSCRIPT:EA7URC_DXC.scr>
```

- optional "Check QSL" flag is added to the DxCluster dialog. (see system menu in that dialog)

- PACTOR-1 LP mode is added, RX only :-(

- Telnet dialog is implemented to access DxClusters via telnet.

- DxCluster dialog:
  - WWV page can be called.
  - Modified Settings dialog.
  - Font selection is added.

- Memory dialog is added to watch Ctrl+1..10, Sh+Ctrl+1..10 channels. See menu Options.

- SSTV FSKID is added, compatible with MMSSTV, turned on by default, recommended, can be turned off in SSTV mode settings.

- Search result:
  - column widths are remembered.
  - Esc returns to the previous dialog.
  - Set QSL Rcvd, Set QSL Sent added to the local menu. That allows input multiple QSLs at a time.

- Log bar resize: doubleclick on the edge of logbar, resize, doubleclick again.

- New macros:
  - OnOpenTncWindow, OnCloseTncWindow, OnOpenTelnetWindow, OnCloseTelnetWindow, use these macros to run specified commands when TNC or Telnet window opens or closes.
  - <CLOSERXWINDOWS> closes all opened secondary RX windows
  - <YAPPRECV>, <YAPPSEND>, <YAPPSEND:filename> - YAPP support
  - <MYMAINCALL> returns callsign stripped from "/P"."/QRP" etc.
  - SSTV specific macros:
    - <LOCKMODE>, <UNLOCKMODE> - lock/unlock current SSTV mode
    - <PUTRXPICT:x0:y0:x1:y1> - put received picture into the specified rect
    - <PLACETEXT:x:y>, <PLACETEXT:x:y:text> - place text to specified x,y
    - <TEXTSTYLE:n> - set current text style
  - <TNCSCRIPT:filename>, <TELNETSCRIPT:filename> - run script file in 2nd TNC or Telnet window.

```

hi all,
well i wonder if any of you ever heard of a way to decode
the Motorola Trunking system via a software and a soundcard ?
According to what i found in the internet ,there is no scanner available
that is capable of decoding this signal.

can anyone help me,i was thinking of a soundcard,with a pc connect to a
scanner,speaker outlet,and the software would decode this transmission,did
it exist?

thanks for the help
gervais

> In addition, I would also like speeds in excess of the 1200bps most people
> talk about, is there anyway of acheiving ~128kbbps? I realise it's very
> fast, but I mean, if people can do 54Mbps over 802.11b, then I presume
it's
> gotta be EASY to adapt it.. Hasn't it?

Snip------

Its anything BUT easy! A 802.11b signal is spread over an extremely wide bandwidth - I'm not sure of the exact number but I guess it's at least several tens (if not hundreds) of megahertz. There's practically nowhere in any part of the regulated radio spectrum where you can do that with more than a very low power transmitter - which is exactly what 802.11b does. If you and your friends are close enough and at fixed positions - and very high bit-rate is an absolute necessity - you might consider using lasers beamed at each other through telescopes. It should work over a couple of miles - provided you have clear line of sight. You'll just have to check on the power limits allowed for open air laser beams.

Hi,

I've bought a used TS450 (for 750$CAN...excellent deal!) and I want to used it for digital communication. I've heard some people talking about a problem with audio distortion when connected to a digital terminal like PK232 and Kantronic equipment. Is that right? Somebody could explain me the problem with more details?

I've another question, I've got a KPC3 that I use for 2M digital communication. I think it's a very good product useful and very user friendly. So, I'm looking for a HF digital terminal useful like the KPC3. Could somebody can give me some comments on those that are on the market like Kam98, KamXL, PK232MBX ???

I want to try some new (new for me) digitals mode like RTTY, PSK31, AMTOR, PACTOR, etc.

Thanks for your comments!

Best 73's from VE2BQA, Martin

Mouser, DigiKey, and most small electronic parts stores stock them. There are several hobbyist shops in SD that stock this sort of thing. I've been in them with friends, but can't recall names or locations. You get some more local guidance.

In the manual for the 1200 baud modem it says that the audio output level is set by jumpers. The default is 50 millivolts p-p. That would mean 25 millivolts above the line and 25 millivolts below. This would convert into 0.707 x 25 mv = 18 millivolts RMS.

I have some doubt about this. I would beieve 36 millivolts RMS (meaning I think they should have said 100 millivolts p-p), 18 seems pretty low for typical drive for a radio, so I am thinking their description is not accurate.

I would measure this if I had one available, but does any one know from experience what the actual level is?

Please reply to the group or at my address at November Five India November at the ARRL NET. I am trying (so far unsuccessfuly to avoid spammers picking up my address)

Ron N5IN

Hi Martin,

I cannot comment on the TS450 but I can comment on the various options available today to get into the digital modes.

You may want too first try to get into the digital modes using a computer with a sound card. All you need is a simple interface to connect the sound card to your rig. You can buy a commercial unit like RigBlaster or the MFJ unit or you can build your own with parts from RadioShack. The interface only consists of a few parts. Then use some of the great FREE software out there. Below is a brief list

MMTTY for RTTY -- see www.qsl.net/mmhamsoft
AGW Packet Engine for 300 baud HF packet or 1200/9600 baud VHF packet
Hamscope for RTTY, MFSK16, PSK31 and packet
Digipan for PSK31
MT63 by IZ8BLY for the MT63 mode
STREAM for MFSK16 and PSK31
Zakanaka for RTTY and PSK31
WinWarbler for RTTY and PSK31

There is a lot more FREE software out there. Just search the internet and download the program!

The best all in one multimode FREE software program for the soundcard is Hamscope.

The only other really good multimode program for the soundcard is MixW32 by UT2UZ but it is shareware.   MixW32 supports the most modes in one software package.

The sound card approach is great BUT you will be out of luck if you want to run AMTOR or PACTOR.   If you are interested in these BURST modes you will need a Multimode controller like the PK232, Pk-900, KAM or the SCS PTC units.

In my experience the PK232 or the PK-900 do a better job at AMTOR and PACTOR 1 than the KAM or KAM Plus. (I have not tried the new KAM XL). But if you want to use the PACTOR II mode (or the Pactor III mode), you will need a SCS PTC II, PTC IIe or PTC II Pro.   Great units but pricey. see www.scs-ptc.com. Pactor II is VERY fast and reliable.

You may also want to look at the HAL DXP-38. It supports RTTY, AMTOR, Hal's

CLOVER II mode and HAL's P-Mode. The P-mode is supposed to be compatible with PACTOR 1. When I last tried the Hal's P-mode it was a little buggy. Links would drop unexpectedly but perhaps it is more reliable with Hal's new firmware updates. Unlike many other TNC's, HAL supplies Windows software for your PC with the DXP-38. You can even run PSK31 using this software with your sound card. It is not a bad deal for a new TNC. But CLOVER II has not really taken off. Pactor (especially the newer Pactor II mode) is much more common. (see www.halcomm.com)

But if you want to save $$, try the sound card approach. I think you will find that your computer's sound card will outperform many multimode controllers on the market! But If you want to run AMTOR or PACTOR I, you will need a multimode controller. Buy a second hand PK-900, PK-232 or KAM off EBAY.

Good luck,

Rob

Look For XPWin (XPWare). It allows all the modes, cam be used with a
variety of TNCs and has a 100 free use before registering is required.

Greetings,

I have joined Beaconet and installed a 1200 Baud USB Packet Beacon
on 28.128.0 Mhz (Ten meters). Running a huge 15 watts into
a vertical antenna at 25 foot elevation.

I will QSL anyone copying this beacons text/message to me.

73

Terry

Don't rush into buying or building any of the complex "interfaces" until you have tried the simple solution...

Download the evaluation copy of MiXW plus its help files from www.mixw.net - the help file includes a lot of good info on connecting radios to computers and MixW is a good package to learn on even if you subsequently decide to use one of the completely free packages later.

My only criticism of the advice given in the MixW files is that they really do not attach enough importance to filtering and decoupling - computers generate an awful lot of RF noise which can really wipe out weak signals. At least with my laptop, all that was necessary was to wind several turns of each cable round a medium sized ferrite ring near the connections with the radio - that got the noise level down to acceptable levels. You may find that you are less lucky and that this is not enough, in which case you may need to look at the commercial interfaces such as RigBlaster etc. but try the direct hookup first...

The Mode is 1200 Baud Packet USB as per the Subject.

Would be nice if you could copy it in .au Land!

73

What frequency, Terry? 28.128.0 USB doesn't tell me how to set my receiver unless I know the modulating tones.

Boy, amen to that! The connections are terribly simple. The expensive box can perhaps be a win when you have bunches of stuff to connect and need to bring some order into it, but if you just want to run PSK or whatever, run a couple of wires. If you're the real nervous type, maybe an optical isolator on the T/R line. That's about it.

The bit about MixW is a good one. If you are just starting out, I would make a cable from the radio's speaker (or audio out if it has one) into the line input on your soundcard and start by receiving PSK and SSTV. Depending on the rig, you probably can buy a cable at Radio Shack if you are terribly frightened of soldering irons. But for around five bucks you can at least see if any of the digital modes appeals to you. Then decide whether a little soldering is worth it, or maybe you want to go ahead and spend the bucks on a box. Nothing wrong with the box, just a lot of $$ for little function.

Here is how I did mine. My (Kachina) uses balanced audio in. Previously I used the same style interface on an unblanced input. On some rigs I have found it beneficial to use a POT on the computer audio out line. Right now I am going simple. Out of the sound card speaker plug, I have a Y cable, to feed the speakers and the rig. I used a Radio shack inline headphone volume control to attenuate the signal to the radio a bit.

Hello. I am interested in APRS. I've been to aprs.org and other sites, but still can't find many details about it. So what would I need to put a setup in my car? A GPS and radio? A computer, too? I can't find this information (frustrating...).

Anyway, I was interested in this 'MIM Module' I've read about, I think this could help me somehow, but of course the MIM Module link on aprs.org is broken.

So can anyone offer any pointers? I am interested in a low budget setup.

Also what would I need on the receiving side to track the system's location?

How can/does APRS interface with the internet? I have a direct internet connection at home.

Thanks for any help.
-Ryan

Hi,

I'd like to port APRS capability to my Jornada 720 Handheld PC and
also to the new .NET framework.

Does anyone have demodulator source code (in C would be nice) that I
can have?

Is this stuff GPL or public-domain or is it all close-source?

Thanks,
John

hi john,
well sound card and packet are not use in north america as i can find informations.
i have a ge phoenix to connect to it,a soundblaster 16 .
and also an old pk232 on the shack that is almost in this pension.

73/s and merci for the helping hand.

hi,well you should consider the uplink and downlink frequencies of the iss.i
dont know aboit the pc but the tnc upthere must be running by itself

145.800 listen
145.990 transmit + - with the doppler effect

Yeah, pity that they chose that pair...  none of my 2M transceivers can
make it, I would need to use a separate rx and tx.

(shift is only settable in 100 KHz steps...)

What do you mean? Demodulate 1200 baud AFSK?

"APRS" requires a couple of other layers on top of that. But I would
call that "decoders" rather than "demodulators".

>Is this stuff GPL or public-domain or is it all close-source?

In the Windows world it probably is all closed-source.   In the Linux
world there is of course GPL'ed source.

Are you sure about those frequencies?
The info I have is 145.800 down and 145.200 up - the same as a standard
terrestrial repeater. Or is it different for packet and voice?

73

Here's another site to check http://www.nwaprs.org

You do not need a computer in the car, all you need is a GPS, TNC or Tiny Trak (from http://www.byonics.com/) and radio. OR one of the new Kenwood rigs.   If your on packet, you already have everything you need for APRS in the shack. You just need the software. There are links to all the software sites at the NWAPRS site. If your on a budget, take a look at UI-View. It's the only freeware aprs software out there. If you don't have a tnc, you can use your sound card.

Another site you might want to check is
http://web.usna.navy.mil/~bruninga/aprs.html
Good Luck!

Its not too hard to use the digipeater on the ISS, typically you set
your rig for split operation on the previously noted uplink/downlink
frequencys. Now if you have your TNC connected properly you will be
listening on the downlink and transmitting on the uplink, Test this by
monitoring a few passes to make sure you'r receiving the packets
correctly. Here is a URL describing the TNC setup commands you need.
You don't need much in terms of antennas to operate both ISS and
NO-44.

http://www.marex-na.org/fileshtml/roundtableiss.html you should
definitely be checking out www.amsat.org as well. Once your operating
normaly on ISS try PC-Sat/NO-44 as well. You should also read up on
the APRS system. http://web.usna.navy.mil/~bruninga/aprs.html

              Good Luck

145.800 listen
145.990 transmit + - with the doppler effect

These are the correct frequencies for ISS packet operation. I never
had to adjust for doppler. I don't think it's such an issue on 2M as
opposed to 70cm. I typically can recv/transmit reliably from only a
few degrees above horizon to horizon, with no doppler adjustment using
an eggbeater type antenna.

Can you point me to in the direction of a Linux open-source APRS
project?

I have a buffer of complex samples that I would like to
demodulate/decode and then display the information.

Thanks,
John

I have complex (IQ) samples. I think I need a demod to get to symbols
and a decoder to get to bits/text. Right?

John

Well, you will have several layers in that case...
```

First you need to demodulate the samples as NBFM audio (probably not the first choice to do that using DSP from IQ samples, but of course possible).

Then you have a 1200/2200 Hz FSK signal (1200 baud) that you demodulate to ones and zeroes and recover the clocking info.

On top of that is NRZI coding and HDLC framing (flags, bitstuffing, crc-16).

The frames contain AX.25 UI (two callsigns, a databyte identifying UI, a protocol ID of 0xf0 and the ASCII data sent by the APRS station).

The data part is encoded as specified in the APRS spec, there are several formats for the same (and for different) type of data.

Finally you of course have to present the decoded data to the user. That would mean things like plotting positions on a map, keeping lists of recently heard stations, displaying chat texts in a scrolling window, etc.

This is available as "soundmodem" modules for Linux as (configurable)
part of the standard kernel.

>Can you point me to in the direction of a Linux open-source APRS
>project?

The top part (decoding and display) is available as X-APRS.  I think
there are others too.  Such programs use the AX.25 functionality in
the kernel (via a socket interface) which in turn uses modem or hardware
driver modules.

Some searches with Google using keywords like linux, aprs, packet,
soundcard, etc will yield many results pointing to sources, howto's etc.

Rob

There is now also user-mode soundmodem, which should work with any
soundcard supported by the kernel. There is probably a link to it at
<http://radio.linux.org.au>.

Instead of XAPRS, which is NOT open-source (is it still being
developed?) take a look at Xastir <http://www.xastir.org>.

Go to MAXXIM web site and request sample and they will send you a couple
free, or at least they use too.
I did and, received them, but was couple of years ago.

I am looking for a good condition Dovetron 1000 to run my Teletype Model 15.
I am also looking for a good condition Model 28 ASR within driving distance
of Houston.

Please advise if you have one of either you no longer use.

Thanks,

Jim Andrew, K5UI

I'm guessing you're talking about SSB radios and not FM radios, and thus talking about a broader range of modes than the 1200 baud AFSK and 9600 baud FSK found in VHF/UHF FM-based packet.

Certainly for FSK modes (RTTY, 300 and 1200 baud FSK), AGC on and fast is preferred (since the first thing a self-respecting FSK modem seeks to do is eliminate AM-sensitivity).

There might be a case for AGC on and slow for some of the PSK modes since PSK can certainly introduce an AM component, but my generalization of this is the AM component is primarily due to transmit bandwith-reduction processing and AM distortion in reception, unless severe and of a relatively high rate, is not of a major consequence. In any case, the fast-AGC response time of most receivers is probably still slow relative to the AM components of a common signal.

So - I say fast-AGC all the time if possible (though some receivers don't offer it in SSB mode).

Any differing opinions?

Rob,

Thanks for describing the layers. I'll check out the kernel source for AX.25 (I didn't realize that APRS rode on top of AX.25 -- I should have known that).

I suspected that any APRS demodulator code I got would expect FM discriminated data as input so I have already written this code.

The only issue is going to be that I'm using .NET and C# so I'll have to translate from C to C#. No big deal -- I'll really learn the code.
:-)

John

I have a Garmin basis eTrex GPS unit connected to a KPC3+ packet TNC being used in "tracker" mode and that is now connected to an FT-1500 2 meter rig set on 144.390. All you have to do is configure the TNC as per some instructions on the web and your on!

http://map.findu.com/wb8nut-12 will show you my location. At the house I am running UI-View and it operates as a digi on the east side of Cincinnati and gates all local traffic to the internet.

Let me know what you want to do and I will try to help.

Duffy

Has anyone identifed and compared the various integrated programs? By integrated, I mean the program fully implements CAT, multi-mode emission encoding-decoding-display, DSP and logging.

I have been trying to set up an FT990 with FIF-232C to work with one of these programs and find that no one seems to have their arms around all the important details for the radio, the interface and the software. For example, MixW can key CW via DTR but Skysweeper can't do that [yet]. By permitting this, MixW lets you use your narrow CW filters and QSK.

It looks to me that with PC's getting faster, that this is where the action will be -- rather than in further radio development. Moreover, there could be much more standardization of interfaces than there is.

After all my investigation, I am still puzzled by one thing: Most folks seem to opt for interfaces that plug into their microphone DIN jack. What do they do when they want to use their microphone? Unplug the Rigblaster or Rascal and plug in the microphone? Or use the cheesy little PC microphone that plugs into the sound card?

Have a bad eprom in a PK-88. Firmware E1744. Have not been able to
find a .bin file on web to load another one. Used the TF bin to verify
my eprom is bad. Anyone have a programmed eprom or know a location for
a bin file to program a replacement? Thanks!

Another interesting detail that had to be dug out is how CAT is

handled by these programs. For example, MixW puts its CAT signals out
on the same COM port as PTT and CW keying. But none of the
off-the-shelf sound card interfaces seems to provide. So you have to
put a splitter on your COM port and connect two cables.

Hello,
Thank you for taking the time to read this message.
I have a Kenwood TS-940S with a Kantronics (ALL MODE) VER. 6.0
CONNECTED to the Kenwood. I have been going out of my mind trying to
figure out how to config. the
TNC and Program to work c.w. send and receive as well as RTTY,
AMTOr,etc. Prior to this in 1993 I owned
a Yeasu FT-990 and all I did was wire up the din for the 990..fire up
the TNC
progam..(Lan_link) >> Kinda outdated now.. and go into the
c.w. send/rec mode of a program call Lan-Link and that would be it.
For some
reason I can not get the Kenwood TS-940S to work either RTTY or CW
send/rec.
Do I need to buy some type of interface for the TS-940S or a certain
progam? Any iformation will
be greatly appreciated.. I am working on my third bottle of Motrin !!
Thank you for your time, I appreciate it.

Hello all,

I have a TenTec Pegasus and recently after a very busy several years started to get back into digital modes. I have downloaded WinPSKse and been able to successfully receive a few signals.

I could use a little guidence though. WinPSKse is nice in that you can select two different receive signals. So assume I set my radio to receive on 14.070 LSB. I will see several signals in the waterfall graph and I can select RX1 or RX2.

My question is what about transmit? It looks like transmit follows the currently selected RX. IE there is a button to select which one to transmit on but being from the old school, don't I need to tune the radio to that signal? It seems not to care. Any help would be appreciated.

I have not tried transmit yet as I haven't finished cabling etc. Anybody reasonably close to southern california that would volunteer to help me set the TX level by monitoring the signal sometime?

For psk31 you should use USB. Set the receiver to 14.070 to start with and pick out the signal you want to receive with whatever visual means the program has (I am not familiar with that particular one). You should be able to set the audio output to the transmitter to follow the received signal automatically. The transmitter dial is not usually tuned to match the receiver. Much of the time the signals will be contained in or near the 3 Khz bandwidth near 14.070. As you gain some experience you can then move up a few KC if needed or desired.

Also not familiar with the output of the TT but assuming it is a 100 watt output rig, set your audio input level so the transmitt is putting out from 30 to 50 watts with no characters being sent. YOu might want to do this on 10 meters to start with as there is usually more unused bandwidth there..

Greetings fellow Warblers.. Happy to announce that MixW version 2.06 has been uploaded to our Website www.nvbb.net/~jaffejim/mixwpage.htm and is now available for downloading. There were a few bugs in the previous version that were addressed and a few new features added as well. There are:
- Control bar (Macro bar):
- resizing horizontally and vertically (with
changing the number of columns)
- background color can be changed for each button,
see button "A" after "Label" in Edit macro dialog.
- DxCluster dialog rearranged, button "Back" is added, it
jumps to previous frequency (if any).

- Ten-Tec Jupiter support (requires new "Enhanced PC Control"
firmware)
My suggestion is to go to the Changes page and print out the print and have
a "Hard Copy" which will give you in detail what the program can now do.
Best 73 and Happy Warbling. Any questions just drop me a line at:

Hi Frank,

Never heard of " GOOGLE " ? ??
Here you find NBF: http://www.hut.fi/~jtuomi/nbf_index.html
and if you are searching for a complete-full-uptodate
windows packet program, you should try
WinSTOP: http://www.winstop.de/index.html

73'
Tonny on1dnf

PS. I've never heard of T4

Gervais,

The "mother lode" of schematics is at

http://www.packetradio.com/

... I bought one of their interfaces (too lazy to build my own) and it works well.

I am looking for a Tiny Track 2. And also looking for a cheap GPS to get started with APRS.

Please email me at theplanters95(at)aol.com.

Randy ka4nma

I don't know if anyone has seen the website I'm looking for (I hope they have), but I've lost the link so I cant give it to anyone either.
Hoping someone can help me with the web address.

The website is about a bloke in America (maybe Canada I can't remember). He is an amateur that lives in a zone where the power delivery isn't fantastic.
To combat this he set up a car battery in a battery box with a volt meter

and a cigarette lighter socket built in (as well as big posts for his radio
equipment). Apparently this wasn't good enough so he linked up a solar
system to it as well. There were a couple of other attachments also.

Hoping someone can help me out with the address for it.

Thanks in advance,

Brian.
Sydney Australia.

Brian, you would be better off using a battery made for supplying a relatively small amount of current for a longer time. A car battery is optimized to supply a huge amount of current (100 to 200 amps) for a short time in order to turn the starter motor. When the car is running, its electrical needs are supplied by the alternator powered by the engine. Gel cells are really what you want. They are sold for computer room uninterruptable power supplies (UPS) and camper vehicle use. Perhaps you can get them from a computer service company or just buy a couple of new ones. The gel cell have a charging power requirement similar to Nimh batteries and the charge control chips for Nimhs work well for gel cells. Do a web search for "gel cells" and you will get all you need! Also, do a web search for "Luke Enriquez". He is an Australian ham and engineer who has a nice design for a gel cell maintenance system.

Brian,

I don't know about the link you are looking for, but the company I work for sells the item(s) you looking for. Go to http://www.solcomguam.com

Good luck with your battery project.

Rick - KB6IDK/KH2

Don't they have gennies down there? I live in a part of the third world called New Jersey and our electric company, once known as General Public Utilities (aka three mile island) is notable for outages. Some joke on us, they got taken over by First Energy which discovered holes in the Davis Besse nuclear reactor (used to be Cleveland Electric). Ergo hoc, propter hoc I have two generators for power outages.

KG6DX ran two trolling motor batteries with his power supply. Guam was the
land of the blinking clock, and its probably worse now that the money has
left.

Probably so, but a car battery will run the station for an awfully long time. Out here in the wilds of Michigan it's fairly common practice to use a car battery and a trickle charger. Combined they cost less than a "proper" supply, and even the worst ice storm rarely takes out the power long enough to drain the battery.

..

Don't know the site but all you need you will find in yachts chandlery catalogues. We live permanently on 12 v batteries. Solar / wind / additional engine alternator / towed rotator if we could get 12v from rubbing two sticks togethere we would do it.

I'm currently researching the idea of using deep-cycle marine batteries.
A huge battery is cheaper than the stupid little 12V 7AH battery my UPS
needs.

No, I won't be using the huge one with the teensy UPS. I have a pair of
huge old Elgars I got because the charging circuit was overcharging and
ruining the 4 12V 15AH batteries inside. I'm thinking of either repairing
and beefing up the charging circuitry or removing it entirely and kludging
in a real battery charger with some beef to it.

I could get four of the marine deep-cycle batteries cheaper than *one* of
the 12V 15AH batteries.

I keep my ARES Packet Node on a "deep cycle" battery like Russell
describes but got a wet cell intended for electric outboard motors vs a
gel-cel cuz its mucho cheaper (<$50) than gel-cels of the same rating. I
"float" it at 13.8V using a charger made for that purpose so, when (not
if) the AC power fails the station doesn't even notice for at least 24
hours. IIRC the charger was well under $100US and has yet to over-charge
the battery enough to require water.

The "house" batteries in our motorhome use the same system.

Also, just bought a smaller portable wet cell intended for lawn tractors
from Walmart for $15! Figured the portability was worth that small
price.

To all MixW and DigiPan users..and fellow PSK Warblers...Coming soon...we are going to implement the ability to view the receiving station's picture using a small 1kb file in our software... I have just completed a test with one of our programmers the other day as he sent a picture to me using the new method..Although small in size the picture received was in full color and clear as a bell. The band was in terrible conditions and his signal wasn 't even an S 1.This should prove interesting as seeing the other fellow puts a new twist in QSO in PSK/QPSK.. This should really shake things up a bit.. My suggestion is to check our websites weekly or keep you eye on this newsgroup as I will make the announcement on this newsgroup when we release the new versions of MixW and DigiPan. Funny thing..working one fellow the other day.. He described our MixW software as "The Swiss Knife of Digital Communications" sounds good to me. Guess the reason for that statement is that MixW can do EVERY Single one of the Digital modes including Throb, Hellschrieber, MFSK, MT63, Packet, QPSK, BPSK, FSK31 and then some of the old favorites such as RTTY any shift any speed and CW. It also does SSTV and Voice keying. Eliminates the need for the expensive voice keying modules in your rig.. MixW has two logging system one for regular usage and one for contests.. Nick, UT2UZ the programmer is constantly adding new improvements to the program. Some of the new improvements are the ability to access the DX Cluster and also WWV for Solar Flux readings MixW has over 50 Macro keys easily programmed using "Clickable" macros from a easily accessible menu. Plus much more.
To try MixW or DigiPan go to our website which is
www.nvbb.net/~jaffejim/mixwpage.htm
Download the program that best suits you .. Best 73 and thank you for reading this bulletin Jim, WA2VOS

If you didn't make Dayton..

Mendelsons had 12V 17AH batteries for $10.00
They have them on there website for $15.95.
I had talked to them at Dayton and they said they had a lot of these
batteries, and they are New.

I'm not sure what you have in mind. Do you want a solar powered battery? or just a way to have a back up 12v supply?

Astron Power Supply makes a few of thier power supplies with a special circuit (the -BB option) to attach a 12v battery. This turns the Astron into a sort of 12v uniteruptable power supply. During 'normal' times the power supply charges the battery, but if commercial power should fail the battery takes over powering the equipment.

I have this setup running my APRS WX station. The BB option is a special order from most retailers however (they usually don't stock them) As I understand it, the special circuit not only charges the battery, but *protects* the power supply when commercial power fails and power is drawn from the battery. NOTE: I found out the hard way I had to reduce the voltage on my Astron to keep from over charging my battery.

For information on solar (and all types of re-newable) energy check out Home Power Magazine.

It's possible the LINE IN audio level is too low (I use the TAPE OUT jack at the rear, it's level is independent of the AG Gain)
I can also suggest you use the program MMSSVT for the reception of SSTV.

I am using Pacterm 98 with a KPC-3 TNC. I am trying to connect to the local
packet BBS but I am getting a "retry count exceeded" error... I am not real
familiar with the software or even packet in general. Can anyone offer some
advice on what I might be doing wrong?

That's why I'm posting here. I won't buy the program until I understand how to use it and how to get onto the local packet BBS.

Anyone out there want to help me? I'm using HyperTerminal now and I am making some progress, although I can't get onto the packet BBS... I am able to get into my own mailbox though...

Hello all. I am new to packet. I just got my antenna up today and I am eager to get started. I have been unsuccessful in logging into the local packet BBS. I was wondering if I should monitor that frequency (145.030) for activity, even if it's not the BBS or is there somewhere else I should listen?

Message-ID: <20020422231001.07783.00004881@mb-mp.aol.com>
Xref: archiver1.google.com rec.radio.amateur.digital.misc:4794

I am new to packet and I am trying to connect to my local PBBS. I have a KPC-3 TNC. Whenever I try to connect, I get the "retry count exceeded" message. According to the troubleshooting part of the manual, it tells me to turn the squelch to off and see if the RCV LED comes on. It doesn't. It goes on to say that if it doesn't go on that the audio connection should be re-checked, which I plan on doing.

It goes further to state that if I monitor the freq with another radio and I hear no audio, I should increase the AFSK output by adjusting R-13. I did this and I still hear no audio, only the radio keying up (this is also evidenced by watching my power meter).

Any thoughts on how I can get this thing to work?

1200 bit/s is quite usable for APRS and sending DX-spots and one line
messages through DX-clusters using any unmodified radio.

Not very practical for anything else :-).

Pacterm is working fine, you've done everything correctly from a software to TNC standpoint. Sounds like you have wiring problem from your TNC to the radio with the information other message you left in this newsgroup. Might want to check with Ken Baker at Kantronics (service@kantronics.com). He can help you out with your wiring issue.

Check your wiring. Make sure the TX and PTT circuits are correct. For the
correct wiring see this link.

I'm writing my own windows program for APRS. At the moment, it's a bit primative, but it's a big step up from dumb terminal programs, and a sight cheaper than WinAPRS.

Features:

Split window communications with TNC.
Beacon message initiated from PC or TNC, allowing fixed operation.
Fixed or mobile modes.
AEA, Kantronics, Kenwood DC, MFJ, and Pico TNC's supported

I will soon parse the received text. I'll filter or highlight text based on originating callsign. This will be useful for use with the ISS station, and PCSat. If there's interest, I can use maps and/or open the "findu" page on mouse command.

I may also incorporate a satellite tracker to alert the user of passes.

If you're interrested, please email me at k1qn@cox.net, and I'll email the executable back to you as an enclosure. It's about 250K, and 125K zipped. Please specify if you want the zipped version.

The usual disclaimer: For the time being, it's free. Use at your own risk.

Al, K1QN

I heard somewhere that the SCS PTC-II pro wouldn't control some 706 models?
So it would be cheaper to add another serial port to the laptop?

That's what I've figured too.. looks like there's a problem with the audio
wire.. gonna have to check to be sure it's wired correctly.

Perhaps...

In your sound mixer software, (volume control?) there are two different
screens for setting controls. The ones that come up by default are the
PLAYBACK controls.
By clicking on Properties, you can switch to RECORD controls.
Check to make sure the correct input is active, and others are not.

The answer of frequency may vary according to where you are.

Whichever frequency is assigned to "keyboard to keyboard" in your area is probably what you want. Some areas do have packet bandplans which differ from the national one.

I am not sure if that exists here. Is there a national band plan for packet freq's?

The closest thing we have to one is what the ARRL publishes in their repeater guide (in the bandplan section) and again in their "Operating Manual" (chapter 10 - Packet).

For VHF, neither really prescribes the content of a packet channel - only the frequencies which are commonly dedicated as packet channels.

Has anyone succeeded in getting Icom's software to work with the above

```
combination.  The software was working until I installed the UT-106.
Now, it bombs and the program I'm using is scancat.  It works properly
with the receiver, but I'd like to have the Icom interface back.

Thanks in advance.

Harry

I believe keyboard around here, SF Bay area, is 145.05. The ARRL national
band plan, last I looked, was pretty strange. With all kinds of space
allocated to linear transponders that never got built. Maybe they've
fixed it.

I was reading about wireless internet equipment dealing with multipath by locking on each multiple and running the results through a voting system. This system is said to take advantage of multipath conditions to boost speed/reliability instead of allowing the out of phase signals to cancel each other out and reduce your throughput.

Does anybody do that on HF yet? Just curious. Sounds like a good deal.

Charles, N5PVL

I believe the technique used with wireless was actually pioneered at HF, in a system called RAKE at MIT. I've heard a speaker talking about wireless talk about "RAKE fingers" and that's what he was talking about. Of course the late 1950s implementation took an awful lot of hardware.

I don't know if it ever became very practical at HF.

It has been a long time since I used packet and now have the chance to get back to it. However, I am having a problem and am hoping someone else may have the same equipment as I do.

I am using the pk-88 and have a WYSE model 60 dumb terminal. When I power up the works, I get to the command prompt from the TNC. I have already entered my call as instructed by the pk88 manual. What I don't understand is, are the default settings in the pk88 what I should be using? I see the dcd led light up when I get a signal, but nothing is showin up on the screen. I read the manual and believe that if I can read the tnc and send commands to it, that I should see something come on the screen even if garbage. I set to mon 4 and still see nothing. Can someone help. Thanks

I had this happen about 15 years ago, with the same setup. It sweems like I
fixed it by fooling around with the terminal settings. Hope this helps,
thats about all I can remember.

Good luck!

Charles, N5PVL

I am currently struggling with a Pac-Comm Tiny-2 TNC that seemed to work fine for about 3 months, save for occasional random eEprom resets back to default settings. Now it seems that the TNC sits for days sending my location as WAITING FOR GPS DATA. I believe that everything is set properly, but it still doesn't ever accept data from the GPS. The baud rate is correct, the GPS and serial cable are tested fine, the TNC RS232 port works fine with the PC at the same baud rate as the GPS, but I haven't been sending good position data for over a month. Pac-Comm tells me that spikes in my auto electrical can reset the TNC, but this TNC randomly resets even with the vehicle off and parked. Any little bump can also cause the TNC to reset, so obviously there's a shock issue, but even when it's standing still, and I've reprogrammed the TNC for active APRS, the unit refuses to update the LTEXT sentence, and resets after 10 to 20 minutes. Has anyone seen this before? Some folks around here have mentioned in passing that the Pac-Comms are known for random resets, but what TNC do most folks use out there for APRS, and are there any power supply issues similar to what I'm seeing? I've used Tiny-2 TNCs for years for regular packet, and never had a single problem (on AC power, of course). Using them in a mobile app. is another story. What baffles me is that I did get at least three relatively good months from the TNC before this unidentified problem.

TIA,

Doug, N6XQY

Hi,
Im looking for information that will help me learn how to programme a sound
card for spec analysis, rtty decode etc. I'm fine with the dsp, butterfly
diagrams, fft etc but windows and sound cards - hmmmm
any pointers to a good book?

Greg

I've found the following site to give a good introduction into programming a sound card:

http://www.relisoft.com/freeware/freq.html

All the best

John, G4GOY

Charles is on the right track. That "dumb" Wyse Terminal is just smart
enough to be dangerous in that it has mucho settings to talk to a
variety of processors. We use them on everything from routers to SUN, HP
and Motorola single-boards. Unfortunately I don't have a clue what the
settings otta be for a PK88 so you'll have to experiment. View it as an
opportunity to learn all about Wyse terminals (wink).

Soundcards now have a lot of uses for different digital modes and
decoding schemes, but every software/radio combination wants a
different soundcard level setting.

Is there any software out there that can be used to save/restore
soundcard levels.  It would be handy to have it save source, too.
For example, I run aux-in to a HF radio for PSK-31 and line-in to a
scanner for other stuff.

You can also go to the Creative Labs website and download their SDK. It
has a good tutorial, and a lot of sample code.

RGR, I noticed that too. Probably a server issue. You can see the url in his reply, but not the message he replied to.

Hello all. I have just begun playing with packet and I am interested in contacting the ISS. I have the uplink and downlink freqs. Can anyone tell me how I'd go about actually contacting them? Any good webpages on the topic?

HTTP://DXSPOTS.COM can provide AX/IP and AX/UDP access which will allow you to set up a BPQ32 radio node for local access with an internet link for spots. A full time internet connection, such as cable internet or DSL is required.

If interested contact me via the web page HTTP://DXSPOTS.COM

I must not be keeping up too well, since a recent attempt to update the AMPR.ORG DNS records with the UCSD bot is apparently failing - I've been told that the email message is not deliverable.

Has the bot been updated/replaced? Is it numb at the moment?

You need to ask Brian what address he has for you.... Only the mailbox he has for you will work.

I have for sale an Icom IC-756 PRO. I am the original non-smoking owner and it is like new, both cosmetically and operationally. It comes with the original box, hand mike, power cable(never used) and manual. I will ship it in the Lower 48 for $1599. Check out my ratings on eBay, userid: kc2mf

If interested, please send me an email at: k2wo@arrl.net . I can also deliver this radio to the Dayton Hamvention.

Thanks for reading this message.

George

Well, I've heard the ISS a few times on packet now and saw other stations
callsigns listed, but do I actually connect with the ISS? Do I send a C RS0ISS?
I will check out the link that was provided, but any replies would be welcomed.

If you read the information correctly you would have seen that you
cannot connect at this time.
This is because there is no computer attached to the transceiver.
There is some kind of mailbox functionality, but you are requested not
to leave any messages because the crew has no way of reading thme
because of the missing computer.
Be patient and follow the news about ARISS on the website I mentionned
before more news can be found on
http://www.arrl.org too.

I'd try TAPR or Buck Rogers first.

Hi Mel!

Try 145.69 simplex.

That is the frequency that the SWPPG (SouthWest Pennsylvania Packet Group) uses for their nodes. The WA3IOU/BBSIOU node is quite a good BBS, in my opinion!

Hope to see you on packet!!

I was just checking pass predictions for the ISS and was wondering if I was
getting the right data. My coordinates are lat 39.939 and long -74.193.
According to what I've found, the ISS won't pass over again until May 7th, and
then only 1x a day for the next 3 days. Is this correct? Over the last 2 days,
I've had at least 3 pass overs... did I just happen to get a lot of passes at
once?

Hello,

You can download freeware software "Satscape" and then you will probably
find right answer on your question.
Satscape can update from the web all you need, satelite database, keplerian
elements and update your computer clock, very fast and accurate.
Normaly you will have pass prediction, 2D, 3D wiev etc...

Adam

No that probably isn't correct. While you will have fewer passes at 39 degrees than I have at 52, there should be at least a few every day.

So probably you have your elements wrong.

Rob

>I've had at least 3 pass overs... did I just happen to get a lot of passes at
>once?

You don't say what you're using for prediction. Is it perhaps only giving you passes that are visually observable? (That is to say, when the sky is dark enough to see stars but the sun is close enough to the horizon to illuminate something only a few hundred miles above the surface.)

I just went onto a couple sites on the internet that do pass predictions, don't remember the exact websites. Can you recommend one that I can use that will show all passes?

Hi,

Anyone have suggestions for software to use with the M-7000? I've tried
Copycat-pro and it seems OK but expensive for a DOS program. I also have
the logging program on http://www.trifid-nebula.de/index.htm

Anything else around?

Regards,

Anyone, with a knowledge about streaming for a local radio. We want to start one up, but we don't know which format to use, Reals, Microsofts or Shoutcasts? We're on-air three hours a day and we want to send MP3s the other time. So the server/program has to take the input signal the three hours and then switch to MP3 the other time.
Is one of the abovementioned able to do that, or do we have to buy a package that does?

Soren Sohl

During twilight and dawn you can actually see the ISS passing by when there
are no clouds in the sky.
...and then there are the passes during daytime and when it passes you in
the earth's shadow at night time.
The sum makes " all ISS passes" ;-))

A "visible" pass is one where (part of the) pass has the ISS in sunlight
while the observer is in darkness.

That is useful information for the "visual" observer but not very useful
for radio amateurs.

Try www.heavens-above.com . I use that all the time for information related to satellites and the ISS. I can hear the ISS (packet) every time it comes by but cannot connect. Guess it takes a little more than an HT to hit it. Otherwise it comes in super-strong.

With alot of non-HF people out there and the abundance of equipment for use on VHF/UHF and the simplicity of PSK-31, why cannot we use it those bands?

It seems to me from my limited understanding of how PSK-31 works, is that it is relatively short bursts of information send in a tone that sounds like a warbled whistle kind of sound. Granted FM does take alot more bandwidth, but you are not transmitting all the time. Seems like this would be a much more effective use of local (within state or from county to county etc...) digital communications. Packet can seem to be buggy from time to time.

Please let me know if I am wrong, or if this would work or ??? I am fairly proficient with packet now, and would be curious to explore PSK-31, but I am limited to FM on 144, 220, and 440 but do have all-mode capability on 6 meters.

Thanks,

Connecting to the ISS may be a little bit impossible as there is no computer attached to the TNC.
At least that is my understanding of the information on the various websites on this subject.

This is mentionned at http://web.usna.navy.mil/~bruninga/iss-faq.html

I'm sure ARISS is working on the further development of the ISS-amateur-station.
There still is enough time, the station is supposed to last for 15 years

or so :-)

> is relatively short bursts of information send in a tone that sounds like a warbled whistle kind of sound. Granted FM does take alot more bandwidth, but you are not transmitting all the time. Seems like this would be a much more effective use of local (within state or from county to county etc...) digital communications. Packet can seem to be buggy from time to time.

Actually, PSK31 is similar to RTTY, where stations typically take turns transmitting in a half-duplex fashion and it is *not* packetized. Once you start transmitting, you continue doing so until you're finished typing whatever you intend to type. Further, PSK31 is used without FEC or error correction, the idea being that one can tolerate some amount of errors in a conversational keyboard-to-keyboard exchange. If you stop or pause typing, you continue transmitting the PSK31 carrier until you start typing again or stop transmitting.

The actual bandwidth of the PSK31 signal is very, very small but it's usually generated on a 1KHz (or so) carrier, which is frequency-translated by an SSB transmitter and results in what appears to be a very narrow PSK-modulated carrier (< 70Hz). Transmitting this as FM audio would result in an FM signal approximately 7KHz wide for the same throughput, which is terribly ineffecient and likely would not experience the same resilience for low signal levels.

In other words, PSK31 doesn't make much sense for the use you describe, though it's certainly possible (and I'm sure it's been done already).

I don't know what you mean by packet being buggy in this case, it's certainly sensitive to how people set up their signal levels and TNCs, but, with a little care, packet is can be quite good. The most common problem with packet I've seen is people over-driving the transmitters into audio limiting - it's better to turn the audio down a bit than it is to over-drive.

> Please let me know if I am wrong, or if this would work or ??? I am fairly proficient with packet now, and would be curious to explore PSK-31, but I am limited to FM on 144, 220, and 440 but do have all-mode capability on 6 meters.

PSK31 as a local comms mode via an SSB transmitter on 6m might be interesting, though.

Must be outdated information because I've been watching packets go through the ISS over the last few days and today I made my first contact via the ISS packet station!

As a matter of fact, here's a cut and paste of my very short QSO:

```
KC2SSB>CQ,RS0ISS: <UI>:
Can anyone confirm I am making it? My first contact via ISS

KB3BRT>FN1FW,RS0ISS*: <<UI>>:
QSL SSB

KC2SSB>CQ,RS0ISS: <UI>:
Great, tnx!

VE2FCA>CQ,RS0ISS*: <<UI>>:
73's to all de francois email:ve2fca@hotmail.com hi all

K2RQA>CQ,RS0ISS*,FN32FN,DON: <<UI>>:
HI KC2SSB

KC2SSB>CQ,RS0ISS: <UI>:
HELLO DON
```

This was with a Yaesu FT-1500 at 50 watts and an MFJ 2/6m dualband vertical at 20 feet. At the time of this pass, the ISS was well north, into Canada.

Making contacts through the ISS is something different than contacting
the ISS itself.
If I understand it correctly the system currently available is a
digipeater.
So you send up a packet and the ISS sends it down again. No computer
needed there.

If you wish to contact the crew, and tell them whatever you want to tell
them, they will need a computer with appropriate software to receive and
read your message, and my understanding is that they currently don't
have something like that.

Please prove me wrong, I would love to get a message though to those
guys.

Peter O

The first time ever that anyone from Africa is in space - Mark
Shuttleworth, he arrived there a few days ago on a Soyuz - and the system is
disconnected!!!!!

I understand that. But use in our WAAAAAAYYYYY under-utilized bands doesn't
sound like it would be problem. VHF and UHF are practically dead around
here.

>

Well... yes and no.... If that is the only means I might have in an
emergency to communicate at the time, I might utilize it. Of course there
would have to be someone on the other end also.

Well... noise (any kind) seems to be a b*tch, for instance if a car with a noisy electrical system drives by, or other interference like that.

I was just curious if there was the interest in utulizing other digital modes on VHF/UHF frequencies. I cannot speak for the rest of the country but around here there is usually only band opening of 6m usage, next to nothing on 220, fair to poor utilization of 2 meters and other than remote reciever and other similar cross-banding type of work on 440, that band is quiet too.   I know that an FM signal is definitely a "wide" signal, but there is still a lot of simplex frequencies that could be utilized in the four main VHF/UHF bands. Also would be neat to experiment with it in the 900Mhz and 1.2Ghz allocations too.

The main problem with trying to operate SSB on VHF and above frequencies is that there is little equipment available for such operation.
